**Identification Codes****Vehicle Identification Number (VIN)****Vehicle Identification Number (VIN) Location**

The Vehicle Identification Number (VIN) is a 17-digit combination of letters and numbers. The VIN is stamped on a metal tab riveted to the instrument panel, top upper left of the instrument panel. The VIN is also found on the Vehicle Certification (VC) label. If the VIN plate requires replacement, authorized dealers must contact their respective regional office.

Item	Description
1	World Manufacturer Identifier (WMI)
2	Restraint type code
3	Vehicle line and series code
4	Engine code
5	Vehicle Identification Number (VIN) check digit
6	Model year code
7	Assembly plant code
8	Production sequence number

**World Manufacturer Identifier (WMI)**

The first 3 VIN positions are the World Manufacturer Identifier (WMI) code.

- 2FA - Ford Motor Company of Canada Ltd., passenger car
- 2ME - Ford Motor Company of Canada Ltd., Mercury, passenger car

#### Restraint Type Code

The fourth VIN position is the vehicle restraint system type code.

- B - Active safety belts - all positions, driver and front passenger air bags and driver and front passenger side impact air bags

#### Vehicle Line and Series Code

Positions 5 through 7 indicate vehicle line, series and body type.

- P7A - Crown Victoria (Long wheelbase)
- P7B - Crown Victoria (Police Interceptor)
- P7C - Crown Victoria (Base fleet vehicle)
- P7E - Crown Victoria (LX 4-door)
- M7A - Grand Marquis (Long wheelbase)
- M7E - Grand Marquis (GS 4-door)
- M7F - Grand Marquis (LS 4-door)

#### Engine Code

The eighth VIN position is the engine displacement and number of cylinders code.

- W - 4.6L electronic fuel injection, SOHC, 8-cylinder, gasoline
- V - 4.6L electronic fuel injection, SOHC, 8-cylinder, flex fuel

Additional engine information can be obtained from the engine tag. Refer to [Section 303-01](#).

#### Check Digit Code

The ninth VIN position is the check digit code (0-9).

#### Model Year Code

The tenth VIN position is the model year code.

- A- 2010

#### Assembly Plant Code

The eleventh VIN position is the assembly plant code.

- X - St. Thomas, Talbotville, Ontario (Canada)

#### Production Sequence Code

## 2010 Crown Victoria, Grand Marquis Workshop Manual

The last 6 VIN positions are the production sequence number. These 6 digits also are used as the vehicle serial and warranty number. The serial number can also be found on the engine block, transmission and frame.

- Ford - 100001-599999
- Mercury - 600001-999999

### Vehicle Certification (VC) Label

#### Vehicle Certification (VC) Label Location

The upper portion of the Vehicle Certification (VC) label contains the manufacturer name, the month and year of manufacture, the certification statement and the Vehicle Identification Number (VIN). It also includes Gross Vehicle Weight Rating (GVWR) as well as tire size and pressure ratings. The VC label is located on the LH front door edge.

If a vehicle requires replacement of the VC label and is 4 years old or less, an authorized dealer must submit the VIN to their respective regional office. The regional office will submit a web form to the assembly plant for the replacement label. Once the label has been printed, a representative from the regional office will deliver the label to the dealer and witness installation on the vehicle. If a vehicle is more than 4 years old and requires a replacement label, the dealer must submit a request to the Department of Motor Vehicles.

Item	Description
1	Exterior paint color code

2	Region code
3	Domestic special order
4	Interior trim code
5	Tape/paint stripe code
6	Radio code
7	Axle code
8	Transmission code
9	Spring code
10	Powertrain calibration information

### Paint Code

The first set of numbers/letters listed indicate the vehicle primary body color code. The second set of letters/numbers listed (if applicable), indicate a 2-tone or accent body color code. All colors are base coat/clear coat.

#### Primary Body Color

- AQ - Arizona Beige
- BU - Medium Brown Metallic
- BY - School Bus Yellow
- HG - Smokestone
- JL - Dark Toreador Red
- JP - Silver Birch Metallic
- KR - Norcea Blue Pearl
- LK - Dark Blue
- LM - Royal Blue
- LN - Light Blue Metallic
- LS - Light Ice Blue Metallic
- MM - Ultra Blue
- TM - Light Gray
- TN - Silver Gray Metallic
- UA - Ebony
- WT - Performance White
- YG - Medium Titanium

#### Accent Body Color

- AQ - Arizona Beige
- BU - Medium Brown Metallic
- BY - School Bus Yellow
- HG - Smokestone
- JL - Dark Toreador Red
- JP - Silver Birch Metallic

- KR - Norcea Blue
- LK - Dark Blue
- LM - Royal Blue
- LN - Light Blue Metallic
- LS - Light Ice Blue Metallic
- MM - Ultra Blue
- TM - Light Gray
- TN - Silver Gray Metallic
- UA - Ebony
- WT - Performance White
- YG - Medium Titanium

## Interior Trim Code

The interior trim codes are listed below. The first letter/number is for the interior fabric. The second letter is for the interior color.

- B - Atmore cloth 50/50 bench, Ford
- C - G-Grain vinyl 40/20/40 bench, Ford
- D - Atmore cloth 40/20/40 bench, Mercury
- F - Luxury Atmore cloth 40/20/40 split bench, Ford
- H - Stockton cloth (front bucket with cloth rear seats), Ford
- I - Stockton cloth (front bucket seats with vinyl rear seat), Ford
- L - Milled Pebble leather 50/50 bench, Mercury
- N - Milled Pebble leather 40/20/40 bench, Mercury
- P - Laura cloth (split bench), Ford
- R - G-Grain vinyl seats, Ford
- Z - G-Grain Super Soft Milled Pebble leather 40/20/40 split bench, Ford

The interior trim colors are:

- J - Light Camel, Mercury/Ford
- L - Medium Light Stone, Mercury/Ford
- N - Charcoal Black, Ford

## Tape and Paint Stripe Code

Tape and paint stripe codes do not apply.

## Radio Code

The radio type codes are:

- B - Pre-equipment package 1
- F - Electronic AM/FM stereo
- K - Premium electronic AM/FM stereo with cassette, CD and clock
- X - Electronic AM/FM stereo with 6-disc CD changer
- Y - Radio delete
- Z - Electronic AM/FM stereo with CD player and clock

## Axle Ratio Code

The axle ratios are:

- 58 - 2.73 conventional (non-limited slip) - without traction control
- C6 - 3.55 limited slip
- C8 - 2.73 conventional (non-limited slip) - with traction control
- X5 - 3.27 limited slip
- Z5 - 3.27 conventional (non-limited slip)

Additional axle information can be obtained from the axle tag. Refer to [Section 205-00](#).

## Transmission Code

The transmission codes are:

- Q - 4-speed automatic overdrive (4R75E)

Additional transmission information can be obtained from the transmission tag. Refer to [Section 307-01](#).

## Spring Code

The first 2 characters listed identifies the front spring codes. The second 2 characters listed identifies the rear spring codes.

### Front Springs

- BB - 9W73-18B036-D
- CC - 9W73-18B036-A
- EE - 9W73-18B036-B
- GG - 9W73-18B036-C

### Rear Springs

- 22 - 8W73-5560-D
- 44 - 8W73-5560-A
- 55 - 8W73-5560-B
- 66 - 8W73-5560-C

Rear air suspension codes are:

- 77 - 6W13-5A891-A

## Powertrain Calibration Information

**NOTE:** Powertrain calibration information is limited to a maximum of 5 characters per line on the Vehicle Certification (VC) label. Calibration identification consisting of more than 5 characters will wrap to the second line on the VC label.

Powertrain calibration information is printed in the lower right corner of the VC label. Only the base calibration information is printed. Revision levels will not appear, however, they can be found obtained through a scan tool using the most current software revision.

Item	Description
1	Model year (model year in which calibration strategy was first introduced)
2	Vehicle code
3	Transmission code
4	Unique calibration (designates different hardware for similar vehicles), example: tires and drive ratios
5	Fleet code (describes fleet to which the vehicle belongs), example: 6 - Evaporative Emission (EVAP)
6	Certification region (lead region where multiple regions are included in one calibration), example: A - US federal
7	Revision level (will advance as revisions occur), obtained through scan tool

Powertrain calibration Protocol 3 strategy is explained in more detail in the following:

#### Model Year

Position 1 indicates the model year in which the calibration was first introduced.

- 1 - 2001
- 2 - 2002
- 3 - 2003
- 4 - 2004
- 5 - 2005
- 6 - 2006
- 7 - 2007
- 8 - 2008
- 9 - 2009
- A - 2010

#### Vehicle Code

Position 2 identifies the vehicle line in code.

- FB - Crown Victoria/Grand Marquis

#### Transmission Code

Position 3 identifies the transmission type in code.

- 1 - Automatic transmission

#### Unique Calibration

Position 4 is explained in the following:

The Emissions/Corporate Average Fuel Economy/CO2 Compliance Department is responsible for assigning these calibration codes. Unique calibration identifications are assigned to cover similar vehicles to differentiate between tires, drive configurations, final drive ratios and other calibration-significant factors.

These 2 characters are selected by the analyst to provide identifiable information unique to each calibration. For example, using the number 2 to denote a 2-valve engine versus using the number 4 to denote a 4-valve engine, provides an easily identifiable difference.

### **Fleet Code**

Position 5 - Fleet calibration coding is as follows:

- 0 - Certification (US 4K, final sale in export markets)
- 1 - Heavy duty gas engine/Dyno
- 2 - Fast Automotive Manufacturers' Association, US
- 3 - Alternative durability protocol, US
- 4 - Not assigned
- 5 - Not assigned
- 6 - EVAP
- 7 - Mileage accumulation aging endurance durability
- 8 - On-Board Diagnostic (OBD)
- 9 - Not assigned

### **Certification Regions**

Position 6 - Certification region. Lists the lead region where multiple regions are included in one calibration.

- 5 - US 50 states
- A - US Federal (including altitude, may include Canada or Mexico)
- B - US California standard (includes US green states)
- C - Canada
- D - China
- E - European Community (Austria, Belgium, Denmark, Finland, Germany, Greece, Ireland, Luxembourg, Netherlands, Portugal, Spain, Sweden, United Kingdom)
- F - Extended European Community (Croatia, Czech Republic, Estonia, Hungary, Norway, Poland, Romania, Russian Federation, Slovakia, Slovenia, Switzerland, Yugoslavia)
- G - Gulf Cooperative Council
- H - Hong Kong
- J - Japan
- K - Korea
- L - Malaysia
- M - Mexico
- N - New Zealand
- P - Australia
- Q - South America (Brazil)
- S - Singapore
- T - Taiwan
- U - South America (unleaded fuel)
- V - Vietnam
- X - Rest Of World (ROW)
- Y - Military
- Z - Israel

### **Revision Level**

The revision level will advance as revisions occur. Not printed on label.

---

---

## Jacking and Lifting

**⚠ WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** Never get underneath a vehicle that is supported only by a jack. The jack could unintentionally lower. Always support vehicle with floor stands. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Only raise the vehicle when positioned on a hard, level surface. Attempting to raise the vehicle on an uneven or soft surface may result in vehicle slipping or falling from the jack or jackstand. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** When jacking or lifting the vehicle, block all wheels remaining on the ground. Set the parking brake if the rear wheels will remain on the ground. These actions help prevent unintended vehicle movement. Failure to follow these instructions may result in serious personal injury.

**NOTICE:** The jack provided with the vehicle is intended to be used in an emergency for changing a deflated tire. To avoid damage to the vehicle, never use the jack to hoist the vehicle for any other purpose.

**NOTICE:** Do not attempt to use jack pressure on either the front bumper or the rear bumper of any vehicle. Damage to bumper covers will occur.

**NOTICE:** To prevent possible damage to the underbody, do not drive the vehicle onto the drive-on lift without first checking for possible interference.

**NOTICE:** Make sure the jack has an adequate lifting capacity for the vehicle being lifted.

**NOTICE:** When raising a vehicle on a twin-post hoist, use care when positioning the vehicle so that the hoisting forks do not interfere with the suspension components, mounting brackets or stabilizer mounting brackets, if so equipped. In addition, use care in hoist positioning to avoid possible damage to the axle carrier or rear cover.

**NOTICE:** Damage to the suspension, exhaust or steering linkage components may occur if care is not exercised when positioning the hoist adapters prior to lifting the vehicle.

### Jacking and Lifting Points - Front and Rear

**Torque Specifications**

Description	Nm	lb-ft	lb-in
Catalytic converter-to-muffler clamp nuts	45	33	-
Fire suppression manifold bolts	3	-	27
Fire Suppression System Module (FSSM) bolts	12	-	106
Fire suppressor bolts	30	22	-
Fire suppressor retainer nuts	30	22	-

---

## Fire Suppression System

**⚠ WARNING:** The fire suppression system backup power supply must be depleted before lifting the vehicle or when repairing or replacing any of the following:

- Fire suppression system components
- Components located near the fire suppression manual switch
- Fuel tank and components located near the fuel tank
- Rear axle and components located near the rear axle

To deplete the backup power supply, disconnect the battery and wait at least 1 minute. Be sure to disconnect all auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in serious personal injury.

The fire suppression system is designed to help reduce the risk of fire in high speed rear impacts. The fire suppression system deploys chemicals designed to suppress the spread of fire or potentially extinguish a fire, thereby providing more time for occupants to escape from a crashed vehicle.

The fire suppression system can be activated:

- automatically when a high speed, high energy rear impact has occurred.
- manually when other situations require fire suppression.

In the event of a fire suppression system manual deployment, the fire suppression manifold nozzles will deploy to near ground level and the underbody of the vehicle will be covered with fire suppressant fluid.

**NOTICE:** After system deployment, the fire suppression manifold nozzles may need to be secured in the up position before driving the vehicle through an automatic car wash, or they may come in contact with the automatic car wash components.

The suppressant contains no hazardous materials (but may cause minor skin or eye irritation) and can be readily cleaned up by flushing the vehicle underbody with water, or soap and water. Manual deployment should have no effect on vehicle handling.

**NOTE:** These components must be replaced with new components in the event of a fire suppression system manual deployment. A new fire suppression manual switch must be installed only if the switch cover was damaged during the manual activation.

The fire suppression system consists of the following components:

- Fire Suppression System Module (FSSM)
- Fire suppression manual switch
- Fire suppressors
- Fire suppression manifolds
- Fire suppression system indicator (part of the Instrument Cluster (IC))

### Fire Suppression System Module (FSSM)

**⚠ WARNING:** The tightening torque of the fire suppression system module (FSSM) bolts and the FSSM orientation on the body of the vehicle is critical for correct system operation. Always tighten and orient the FSSM per specifications. Failure to do so may result in incorrect fire suppression system

**operation, which increases the risk that it will not protect vehicle occupant(s).**

The Fire Suppression System Module (FSSM) is mounted underneath the rear seat cushion. The FSSM carries out the following functions:

- Signals the suppressors to deploy the suppressant material in the event of a deployable crash.
- Monitors the fire suppression system for faults.
- Illuminates the fire suppression system indicator if a fault is detected.
- Receives information from the ABS module on the High Speed Controller Area Network (HS-CAN).
- Receives information from the PCM on the HS-CAN .
- Communicates through the ISO 9141 communication network to the Data Link Connector (DLC) any on-demand or continuous memory DTCs, retrieved by the scan tool.

The FSSM monitors the fire suppression system for possible faults. If a fault is detected while the ignition switch is in the ON position, the FSSM will illuminate the fire suppression system indicator located in the IC .

When the ignition switch is cycled (turned off and then on), the fire suppression system indicator remains lit for 6 seconds and then goes out. If a fire suppression fault exists, the fire suppression system indicator flashes or remains lit. The FSSM communicates the on-demand and continuous memory DTCs through the DLC , using the scan tool.

The FSSM includes a backup power supply. This feature provides sufficient backup power to deploy the suppressors in the event that the ignition circuit is damaged in a collision before the suppressors deployment is initiated. The backup power supply will deplete its stored energy approximately one minute after the power is removed from the FSSM .

### **Fire Suppression Manual Switch**

The fire suppression manual switch allows for manual deployment of the suppressors in the event of a fire, when the system has not deployed automatically. Manual activation is possible only when the ignition switch is in the ON position.

The fire suppression manual switch is located in a console on the headliner between the sun visors.

### **Fire Suppressors**

** WARNING: To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.**

The fire suppressors deploy upon receiving voltage from the FSSM .

The fire suppressors are mounted above the rear axle on the No. 4 crossmember.

### **Fire Suppression Manifolds**

The fire suppression manifolds spread the fire suppressant material under the vehicle and around the fuel tank in an event of fire suppression system deployment.

The fire suppression manifolds are mounted on the fire suppressors.

### **Electrical System**

The electrical system that supports the fire suppression system:

- is powered by the battery through the ignition circuit.
  - provides the electrical path from the FSSM to the fire suppressors.
  - provides the electrical path from the fire suppression manual switch to the FSSM .
  - provides the electrical path from the FSSM to the fire suppression system indicator.
  - provides the electrical path from the FSSM to the DLC .
  - provides the electrical path from the FSSM to the PCM.
-

---

**Fire Suppression System****Special Tool(s)**

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2832-A	Diagnostic Tool, Fire Suppression System 501-117
 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent

**Principles of Operation**

The Fire Suppression System Module (FSSM) is non-repairable. The FSSM uses hardwired circuitry, internal sensors, internal back-up power supply, the Controller Area Network (CAN), and the ISO 9141 communication network. The circuitry in the 14C369 wiring harness between the FSSM and the LH and RH fire suppressors is contained within a rigid conduit and cannot be repaired. It can only be replaced if it has been damaged. The fire suppression system can be diagnosed with a scan tool through the ISO network. Communication using the CAN circuits transmits and receives data between the FSSM, the PCM, and the ABS module. Refer to [Section 418-00](#).

It is very important to understand:

- where the input originates.
- all the information necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- whether the module which received the input controls the output of the feature, or whether it outputs a message over the CAN circuitry to another module.
- which module controls the output of the feature.

The FSSM detects high velocity rear impacts, determines vehicle motion, and deploys up to 4 suppressor squibs based on vehicle motion requirements. Deployment of the suppressor squibs activates the disbursement of a fire suppression material beneath the rear portion of the vehicle. A rear collision is sensed by 2 impact sensors located inside the FSSM. Vehicle motion after impact is determined based on deceleration and wheel speed. The Vehicle Identification Number (VIN), model year, and wheel speed information is received by the FSSM through the CAN communication network.

If the FSSM detects a concern with any of the fire suppression system components, an indicator in the Instrument Cluster (IC) is illuminated and DTCs are logged.

A manual switch is present as an override to the system. When the manual switch is pressed with the ignition switch in the ON position, voltage and ground are provided to the FSSM , and the FSSM deploys the fire suppressors.

### Inspection and Verification

**⚠ WARNING:** Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** The tightening torque of the fire suppression system module (FSSM) bolts and the FSSM orientation on the body of the vehicle is critical for correct system operation. Always tighten and orient the FSSM per specifications. Failure to do so may result in incorrect fire suppression system operation, which increases the risk that it will not protect vehicle occupant(s).

1. Verify the customer concern.
2. **NOTE:** If the fire suppression system has been deployed, the following components must be replaced with new components:
  - Fire Suppression System Module (FSSM)
  - Fire suppressors
  - Fire suppression manifolds
  - Fire suppression manual switch (if the plastic cover is damaged)

Visually inspect for obvious signs of mechanical or electrical damage.

### Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Fire suppression manual switch</li> <li>• Fire suppressors</li> <li>• Fire suppression manifolds</li> </ul>	<ul style="list-style-type: none"> <li>• Central Junction Box (CJB) fuse 33 (10A)</li> <li>• Wiring, terminals or connectors</li> <li>• Fire suppression manual switch</li> <li>• FSSM</li> <li>• Fire suppressors</li> </ul>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM .
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:

- Verify the ignition key is in the ON position.
- Verify the scan tool operation with a known good vehicle.
- Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
- If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the FSSM .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

## DTC Charts

### Fire Suppression System Module (FSSM) DTC Chart

**NOTE:** When the Fire Suppression System Module (FSSM) detects a system fault, it causes the fire suppression system indicator to flash a coded sequence of Lamp Fault Codes (LFCs). The FSSM is capable of communicating an LFC for each specific fault that is present, including each flagged fault of a bit-mapped DTC (except for DTCs B1317 and B1318 for which the indicator remains lit continuously). The LFC is made up of 2 numbers. Each of the 2 numbers is 1 or 2 digits, depending on the fault that is present. The 2 numbers that make up an LFC are separated by a hyphen (-) to clearly distinguish between the 2 numbers. The first number is flashed with a 0.5-second interval between pulses. There is a 2-second pause before the second number is flashed, which also has a 0.5-second interval between pulses. There is a 5-second pause between each display of an LFC and each LFC is flashed 3 times after which the fire suppression system indicator remains lit for the remainder of the key-on cycle.

DTC	LFC	Description	Action
B1231	1-3	Event Threshold Exceeded	The fire suppression system was deployed. INSTALL a new Fire Suppression System Module (FSSM), new LH and RH fire suppressors, new fire suppression manifolds and a new fire suppression manual switch (if the plastic cover is damaged). REFER to <u>Fire Suppression System Module (FSSM)</u> , <u>Fire Suppressor</u> , <u>Fire Suppression Manifold</u> and <u>Fire Suppression Manual Switch</u> in this section. TEST the system for normal operation.
B1317	Continuous	Battery Voltage High	GO to <u>Pinpoint Test K</u> .
B1318	Continuous	Battery Voltage Low	GO to <u>Pinpoint Test L</u> .
B1342	1-2	ECU Is Faulted	INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. TEST the system for normal operation.

B1921	1-4	Air Bag Diagnostic Monitor Ground Circuit Open	REFER to <u>Section 413-01</u> .
B2477	5-4	Module Configuration Failure	INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. TEST the system for normal operation.
B2792	12-11	Cross Link Between Firing Loops	<u>GO to Pinpoint Test I</u> .
B2900	11-8	VIN Mismatch	<u>GO to Pinpoint Test A</u> .
B299A	1-9	Suppressor Left Circuit Open - Loop # 1	<u>GO to Pinpoint Test B</u> .
B299B	8-7	Suppressor Left Circuit Short to Battery - Loop # 1	<u>GO to Pinpoint Test E</u> .
B299C	8-3	Suppressor Left Circuit Short to Ground - Loop # 1	<u>GO to Pinpoint Test F</u> .
B299E	8-11	Suppressor Left Circuit Resistance Low on Squib - Loop # 1	<u>GO to Pinpoint Test H</u> .
B299F	8-1	Suppressor Left Circuit Open - Loop # 2	<u>GO to Pinpoint Test D</u> .
B29A0	8-8	Suppressor Left Circuit Short to Battery - Loop # 2	INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. TEST the system for normal operation.
B29A1	8-4	Suppressor Left Circuit Short to Ground - Loop # 2	<u>GO to Pinpoint Test G</u> .
B29A3	8-12	Suppressor Left Circuit Resistance Low on Squib - Loop # 2	<u>GO to Pinpoint Test G</u> .
B29A4	2-1	Suppressor Right Circuit Open - Loop # 1	<u>GO to Pinpoint Test C</u> .
B29A5	8-9	Suppressor Right Circuit Short to Battery - Loop # 1	<u>GO to Pinpoint Test E</u> .
B29A6	8-5	Suppressor Right Circuit Short to Ground - Loop # 1	<u>GO to Pinpoint Test F</u> .
B29A8	8-13	Suppressor Right Circuit Resistance Low on Squib - Loop # 1	<u>GO to Pinpoint Test H</u> .
B29A9	8-2	Suppressor Right Circuit Open - Loop # 2	<u>GO to Pinpoint Test D</u> .
B29AA	8-10	Suppressor Right Circuit Short to Battery - Loop # 2	INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. TEST the system for normal operation.
B29AB	8-6	Suppressor Right Circuit Short to Ground - Loop # 2	<u>GO to Pinpoint Test G</u> .

B29AD	8-14	Suppressor Right Circuit Resistance Low on Squib - Loop # 2	<u>GO to Pinpoint Test G</u> .
B29AE	7-1	Fire Suppression Manual Activation Switch Closed at Key On	CLEAR the DTCs. REPEAT the self-test. If DTC B29AE is retrieved, INSTALL a new fire suppression manual switch. REFER to <u>Fire Suppression Manual Switch</u> in this section. CLEAR the DTCs. REPEAT the self-test.
B29AF	5-1	Fire Suppression Manual Activation Switch High Side Circuit Failure	<u>GO to Pinpoint Test J</u> .
B29B0	7-9	Fire Suppression Manual Activation Switch High Side Circuit Short to Battery	<u>GO to Pinpoint Test J</u> .
B29B1	5-2	Fire Suppression Manual Activation Switch Low Side Circuit Failure	<u>GO to Pinpoint Test J</u> .
B29B2	7-2	Fire Suppression Manual Activation Switch Low Side Circuit Short to Ground	<u>GO to Pinpoint Test J</u> .
B29B3	None	Fire Suppression Indicator Lamp Circuit Failure	REFER to <u>Section 413-01</u> .
B29B4	None	Fire Suppression Indicator Lamp Circuit Short to Battery	REFER to <u>Section 413-01</u> .
P0630	11-8	VIN Not Programmed or Incompatible - ECM /PCM	<u>GO to Pinpoint Test A</u> .
U1900	1-6	CAN Communication Bus Fault - Receive Error	If any ABS module DTCs are present, REFER to <u>Section 206-09</u> . If no ABS module DTCs are present, REFER to <u>Section 418-00</u> .

## Symptom Chart

Symptom Chart

## Pinpoint Tests

### Pinpoint Test A: DTCs B2900 and P0630

**Normal Operation**

The Fire Suppression System Module (FSSM) monitors the communication for a police package specific vehicle ID. If an unexpected Vehicle Identification Number (VIN) or an unprogrammed VIN is detected, the FSSM stores DTC B2900 and/or P0630 in continuous memory.

- DTC B2900 ( VIN Mismatch) - sets when the FSSM detects a VIN that is unexpected.
- DTC P0630 ( VIN Not Programmed or Incompatible - ECM /PCM) - sets when the FSSM detects an unexpected or un-programmed VIN .

**This pinpoint test is intended to diagnose the following:**

- PCM configuration
- Controller Area Network (CAN) communication bus
- FSSM

**PINPOINT TEST A: DTCs B2900 AND P0630**

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
<b>A1 CHECK THE CAN COMMUNICATION</b>	
<ul style="list-style-type: none"> <li>• Review the recorded DTCs from the FSSM self-test.</li> <li>• <b>Is DTC U1900 present?</b></li> </ul>	<p><b>Yes</b> REFER to DTC Charts in this section.</p> <p><b>No</b> GO to <u>A2</u> .</p>
<b>A2 CHECK THE VIN</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Access the PCM VIN .</li> <li>• <b>Does the PCM display the correct VIN ?</b></li> </ul>	<p><b>Yes</b> INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> CONFIGURE the PCM with the correct VIN . REFER to <u>Section 418-01</u> . CLEAR the DTCs. REPEAT the self-test.</p>

**Pinpoint Test B: DTC B299A**

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

**Normal Operation**

The Fire Suppression System Module (FSSM) checks all of the LH fire suppressor circuits for faults. If the FSSM detects an open on the LH fire suppressor squib 1 circuits, it stores DTC B299A in continuous memory and illuminates the fire suppression system indicator.

- DTC B299A (Suppressor Left Circuit Open - Loop #1) - sets when the FSSM detects an open on the LH fire suppressor squib 1 circuits 2312 and 2313. This DTC causes the fire suppression system

indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- LH fire suppressor
- FSSM

#### PINPOINT TEST B: DTC B299A

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

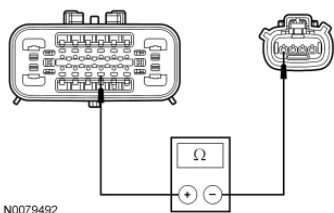

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

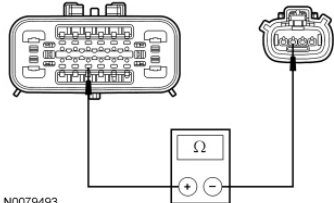

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01.

Test Step	Result / Action to Take
<b>B1 CHECK FOR AN ON-DEMAND DTC OR A CONTINUOUS MEMORY DTC</b>	
<ul style="list-style-type: none"> <li>• Carry out the FSSM self-test.</li> <li>• Was DTC B299A retrieved as an on-demand DTC during the self-test?</li> </ul>	<p><b>Yes</b> GO to <u>B2</u>.</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key in the ignition lock cylinder frequently. REPEAT the self-test.</p>
<b>B2 CHECK THE FSSM</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING:</b> To reduce the risk of accidental deployment, do</li> </ul>	<p><b>Yes</b> DISCONNECT the negative battery cable.</p>

<p><b>not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.</b></p> <ul style="list-style-type: none"> <li>• Disconnect: Negative Battery Cable.</li> <li>• Wait approximately 60 seconds to allow the fire suppression system backup power supply to deplete.</li> <li>• Disconnect: Inline C339.</li> <li>• Install the fire suppression system diagnostic tool to the inline C339, body harness side.</li> <li>• Connect: Negative Battery Cable.</li> <li>• <b>NOTE:</b> DTCs B299E and B29A8 are expected to be retrieved when the self-test is carried out with the fire suppression diagnostic tool installed on the inline C339. These DTCs can be cleared once all the fire suppression connections are restored. If DTC B299E or DTC B29A8 is retrieved with the diagnostic tool disconnected, refer to DTC Charts in this section.</li> <li>• Carry out the FSSM self-test.</li> <li>• <b>Was DTC B299E retrieved as an on-demand DTC during the self-test?</b></li> </ul>	<p>WAIT 60 seconds for the fire suppression system backup power supply to deplete. REMOVE the fire suppression system diagnostic tool. GO to <u>B4</u> .</p> <p><b>No</b> GO to <u>B3</u> .</p>
<p><b>B3 CHECK THE LH FIRE SUPPRESSOR SQUIB CIRCUITS FOR AN OPEN</b></p>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING: To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.</b></li> <li>• Disconnect: Negative Battery Cable.</li> <li>• Wait approximately 60 seconds to allow the fire suppression system backup power supply to deplete.</li> <li>• Disconnect: FSSM C3281a.</li> <li>• Disconnect: Inline C339.</li> <li>• Measure the resistance between the FSSM C3281a-4, circuit 2313 (BK/WH), harness side and the inline C339-4, circuit 2313 (BK/WH), body harness side.</li> </ul>  <p>N0079492</p> <ul style="list-style-type: none"> <li>• Measure the resistance between the FSSM C3281a-5, circuit 2312 (LG), harness side and the inline C339-3, circuit 2312 (LG), body harness side.</li> </ul>	<p><b>Yes</b> CONNECT the negative battery cable. GO to <u>B6</u> .</p> <p><b>No</b> REPAIR the circuit in question. CONNECT the FSSM C3281a and the inline C339. CONNECT the negative battery cable. GO to <u>B5</u> .</p>

 <p>N0079493</p> <ul style="list-style-type: none"> <li>• Are the resistances less than 5 ohms?</li> </ul>	
<b>B4 CHECK THE LH FIRE SUPPRESSOR</b>	
<ul style="list-style-type: none"> <li>• Disconnect: LH Fire Suppressor C4317.</li> <li>• Install the fire suppression system diagnostic tool to the LH fire suppressor C4317, harness side.</li> <li>• Connect: Negative Battery Cable.</li> <li>• <b>NOTE:</b> DTCs B299E and B29A3 are expected to be retrieved when the self-test is carried out with the fire suppression diagnostic tool installed on the LH fire suppressor C4317. These DTCs can be cleared once all the fire suppression connections are restored. If DTC B299E or DTC B29A3 is retrieved with the diagnostic tool disconnected, refer to DTC Charts in this section.</li> <li>• Carry out the FSSM self-test.</li> <li>• <b>Was DTC B299E retrieved as an on-demand DTC during the self-test?</b></li> </ul>	<p><b>Yes</b> INSTALL a new LH fire suppressor. REFER to <u>Fire Suppressor</u> in this section. GO to <u>B5</u> .</p> <p><b>No</b> INSTALL a new fire suppression system harness. GO to <u>B5</u> .</p>
<b>B5 CHECK FOR ADDITIONAL DTCs</b>	
<ul style="list-style-type: none"> <li>• Refer to the continuous memory DTCs recorded during Step B1.</li> <li>• <b>Were any additional continuous memory DTCs retrieved during Step B1?</b></li> </ul>	<p><b>Yes</b> REFER to DTC Charts in this section.</p> <p><b>No</b> CLEAR the DTCs. REPEAT the self-test.</p>
<b>B6 CHECK FOR CORRECT FSSM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the FSSM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the FSSM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>	<p><b>Yes</b> INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. REPEAT the self-test.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

**Pinpoint Test C: DTC B29A4**

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

**Normal Operation**

The Fire Suppression System Module (FSSM) checks all of the RH fire suppressor circuits for faults. If the FSSM detects an open on the RH fire suppressor squib 1 circuits, it stores DTC B29A4 in continuous memory and illuminates the fire suppression system indicator.

- DTC B29A4 (Suppressor Right Circuit Open - Loop #1) - sets when the FSSM detects an open on the RH fire suppressor squib 1 circuits 2310 and 2311. This DTC causes the fire suppression system indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- RH fire suppressor
- FSSM

**PINPOINT TEST C: DTC B29A4**

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

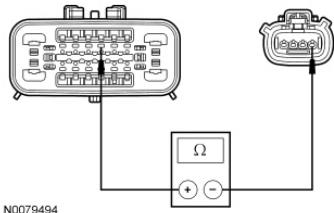

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

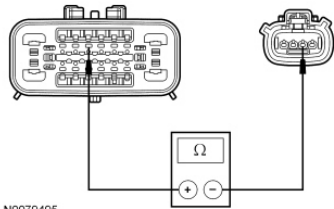

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>C1 CHECK FOR ON-DEMAND OR CONTINUOUS MEMORY DTCs</b>	
<ul style="list-style-type: none"> <li>• Carry out the FSSM self-test.</li> <li>• <b>Was DTC B29A4 retrieved as an on-demand DTC during the self-test?</b></li> </ul>	<p><b>Yes</b> GO to <u>C2</u> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key in the ignition lock cylinder</p>

	frequently. REPEAT the self-test.
<b>C2 CHECK THE FSSM</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING: To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.</b></li> <li>• Disconnect: Negative Battery Cable.</li> <li>• Wait approximately 60 seconds to allow the FSSM back-up power supply to discharge.</li> <li>• Disconnect: Inline C339.</li> <li>• Install the fire suppression system diagnostic tool to the inline C339, body harness side.</li> <li>• Connect: Negative Battery Cable.</li> <li>• <b>NOTE:</b> DTCs B299E and B29A8 are expected to be retrieved when the self-test is carried out with the fire suppression diagnostic tool installed on the inline C339. **Pinpoint Test D: DTCs B299F and B29A9**

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

### Normal Operation

The Fire Suppression System Module (FSSM) checks all of the fire suppressor circuits for faults. If the FSSM detects an open on the LH fire suppressor squib 2 circuits, it stores DTC B299F in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects an open on the RH fire suppressor squib 2 circuits, it stores DTC B29A9 in continuous memory and illuminates the fire suppression system indicator.

- DTC B299F (Suppressor Left Circuit Open - Loop #2) - sets when the FSSM detects an open on the LH fire suppressor squib 2 circuits 2328 (OG) and 2329 (DG). This DTC causes the fire suppression system indicator to illuminate.
- DTC B29A9 (Suppressor Right Circuit Open - Loop #2) - sets when the FSSM detects an open on the RH fire suppressor squib 2 circuits 2326 and 2327. This DTC causes the fire suppression system indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- RH fire suppressor
- LH fire suppressor
- FSSM

### PINPOINT TEST D: DTCs B299F AND B29A9

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>D1 CHECK FOR ON-DEMAND OR CONTINUOUS MEMORY DTCs</b>	
<ul style="list-style-type: none"> <li>• Carry out the FSSM self-test.</li> <li>• Is DTC B299F or DTC B29A9 retrieved as an on-demand DTC during the self-test?</li> </ul>	<p><b>Yes</b> GO to <u>D2</u> .</p> <p><b>No</b> CHECK for causes of the intermittent</p>

	<p>fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key in the ignition lock cylinder frequently. REPEAT the self-test.</p>
<b>D2 CHECK THE FSSM</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING: To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. REPEAT the self-test.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

### Pinpoint Test E: DTCs B299B And B29A5

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

#### Normal Operation

The Fire Suppression System Module (FSSM) checks all of the fire suppressor circuits for faults. If the FSSM detects a short to voltage on the LH fire suppressor squib 1 circuits, it stores DTC B299B in memory and illuminates the fire suppression system indicator. If the FSSM detects a short to voltage on the RH fire suppressor squib 1 circuits, it stores DTC B29A5 in continuous memory and illuminates the fire suppression system indicator.

- DTC B299B (Suppressor Left Circuit Short to Battery - Loop #1) - sets when the FSSM detects a short to voltage on the left fire suppressor squib 1 circuits 2312 and 2313. This DTC causes the LH suppression system indicator to illuminate.
- DTC B29A5 (Suppressor Right Circuit Short to Battery - Loop #1) - sets when the FSSM detects a short to voltage on the RH fire suppressor squib 1 circuits 2310 and 2311. This DTC causes the fire suppression system indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- FSSM

**PINPOINT TEST E: DTCs B299B AND B29A5**

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>E1 CHECK FOR ON-DEMAND OR CONTINUOUS MEMORY DTCs</b>	
<ul style="list-style-type: none"> <li>Carry out the FSSM self-test.</li> <li><b>Is DTC B299B or DTC B29A5 retrieved as an on-demand DTC during the self-test?</b></li> </ul>	<p><b>Yes</b> GO to <u>E2</u> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ### Pinpoint Test F: DTCs B299C and B29A6

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

#### Normal Operation

The Fire Suppression System Module (FSSM) checks all of the fire suppressor circuits for faults. If the FSSM detects a short to ground on the LH fire suppressor squib 1 circuits, it stores DTC B299C in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects a short to ground on the RH fire suppressor squib 1 circuits, it stores DTC B29A6 in continuous memory and illuminates the fire suppression system indicator.

- DTC B299C (Suppressor Left Circuit Short to Ground - Loop #1) - sets when the FSSM detects a short to ground on the LH fire suppressor squib 1 circuits 2312 and 2313. This DTC causes the fire suppression system indicator to illuminate.
- DTC B29A6 (Suppressor Right Circuit Short to Ground - Loop #1) - sets when the FSSM detects a short to ground on the RH fire suppressor squib 1 circuits 2310 and 2311. This DTC causes the fire suppression system indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- LH fire suppressor
- RH fire suppressor
- FSSM

**PINPOINT TEST F: DTCs B299C AND B29A6**

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>F1 CHECK FOR ON-DEMAND OR CONTINUOUS MEMORY DTCs</b>	
<ul style="list-style-type: none"> <li>• Carry out the FSSM self-test.</li> <li>• Is DTC B299C or DTC B29A6 retrieved as an on-demand DTC during the self-test?</li> </ul>	<p><b>Yes</b> GO to <u>F2</u> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key in the ignition lock cylinder frequently. REPEAT the self-test.</p>
<b>F2 CHECK THE LH AND RH SQUIB 1 CIRCUITS FOR A SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING:</b> To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.</li> </ul>	<p><b>Yes</b> GO to <u>F3</u> .</p> <p><b>No</b> REPAIR the circuit in question. CONNECT the FSSM C3281a</p>

- Disconnect: Negative Battery Cable.
- Wait approximately 60 seconds to allow the fire suppression system backup power supply to deplete.
- Disconnect: Inline C339.
- Disconnect: FSSM C3281a.
- Measure the resistance between the inline C339, body harness side and ground as follows:

DTC	Connector-Pin	Circuit
B299C	C339-3	2312 (LG)
B299C	C339-4	2313 (BK/WH)
B29A6	C339-1	2310 (OG)
B29A6	C339-2	2311 (DG)

- **Are the resistances greater than 10,000 ohms?**

and the inline C339.  
CONNECT the negative battery cable. GO to **F5**.

### F3 CHECK THE FSSM

- Connect: FSSM C3281a.
- Connect: Negative Battery Cable.
- **NOTE:** DTCs B29A4 and B299A are expected to be retrieved when the self-test is carried out with the inline C339 disconnected. These DTCs can be cleared once all the fire suppression connections are restored. If DTC B29A4 or DTC B299A is retrieved with all the fire suppression connections restored, refer to DTC Charts in this section.
- Carry out the FSSM self-test.
- **Is DTC B299C or DTC B29A6 retrieved as on-demand DTCs during the self-test?**

**Yes**  
GO to **F6**.

**No**  
DISCONNECT the negative battery cable. CONNECT the inline C339. CONNECT the negative battery cable. CLEAR DTCs B29A4 and B299A. GO to **F4**.

### F4 CHECK THE FIRE SUPPRESSORS

- Disconnect: Negative Battery Cable.
- **⚠ WARNING: To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.**
- Wait approximately 60 seconds to allow the fire suppression system backup power supply to deplete.
- Disconnect: Suspect Fire Suppressor.
- Disconnect: Inline C339.
- Connect: Negative Battery Cable.
- Clear the FSSM DTCs.
- **NOTE:** DTCs B299A and B299F are expected to be retrieved when the self-test is carried out with the LH fire suppressor C4317 disconnected. DTCs B29A9 and B29A4 are expected to be retrieved when the self-test is carried out with the RH fire suppressor C4316 disconnected. These DTCs can be cleared once all the fire suppression connections are restored. If DTC B299A, B299F, B29A9, or B29A4 is retrieved with all the fire suppression connections restored, refer to DTC Charts in this

**Yes**  
INSTALL a new fire suppression system harness. GO to **F5**.

**No**  
If DTC B29A6 was retrieved in Step F1, INSTALL a new RH fire suppressor. REFER to **Fire Suppressor** in this section. GO to **F5**.

If DTC B299C was retrieved in Step F1, INSTALL a new LH fire suppressor. REFER to **Fire Suppressor** in this section. GO to **F5**.

section. • Carry out the FSSM self-test. • <b>Is DTC B299C or DTC B29A6 retrieved as an on-demand DTC during the self-test?</b>	
<b>F5 CHECK FOR ADDITIONAL DTCs</b>	
• Refer to the continuous memory DTCs recorded during Step F1. • <b>Were any continuous memory DTCs retrieved during Step F1?</b>	<b>Yes</b> REFER to DTC Charts in this section.  <b>No</b> CLEAR the DTCs. REPEAT the self-test.
<b>F6 CHECK FOR CORRECT FSSM OPERATION</b>	
• Disconnect all the FSSM connectors. • Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> • Connect all the FSSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • <b>Is the concern still present?</b>	<b>Yes</b> INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. REPEAT the self-test.  <b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

### Pinpoint Test G: DTCs B29A1, B29AB, B29A3 and B29AD

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

#### Normal Operation

The Fire Suppression System Module (FSSM) checks all of the fire suppressor circuits for faults. If the FSSM detects a short to ground on the LH fire suppressor squib 2 circuits, it stores DTC B29A1 in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects a low resistance condition between the LH fire suppressor squib 2 circuits, it stores DTC B29A3 in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects a short to ground on the RH fire suppressor squib 2 circuits, it stores DTC B29AB in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects a low resistance condition between the RH fire suppressor squib 2 circuits, it stores DTC B29AD in continuous memory and illuminates the fire suppression system indicator.

DTC Description	Fault Trigger Conditions
• B29A1 - Suppressor Left Circuit Short to Ground - Loop #2	Sets when the FSSM detects a short to ground on the LH fire suppressor squib 2 circuits 2328 and 2329. This DTC causes the fire suppression system indicator to illuminate.
• B29AB - Suppressor Right Circuit Short to	Sets when the FSSM detects a short to ground on the RH fire suppressor squib 2 circuits 2326 and 2327. This DTC causes the fire suppression system indicator to illuminate.

Ground - Loop #2	
<ul style="list-style-type: none"> <li>• B29A3 - Suppressor Left Circuit Resistance Low on Squib - Loop #2</li> </ul>	Sets when the FSSM detects a low resistance condition on the LH fire suppressor squib 2 circuits 2328 and 2329. This DTC causes the fire suppression system indicator to illuminate.
<ul style="list-style-type: none"> <li>• B29AD - Suppressor Right Circuit Resistance Low on Squib - Loop #2</li> </ul>	Sets when the FSSM detects a low resistance condition on the RH fire suppressor squib 2 circuits 2326 and 2327. This DTC causes the fire suppression system indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- RH fire suppressor
- LH fire suppressor
- FSSM

#### **PINPOINT TEST G: DTCs B29A1, B29AB, B29A3 AND B29AD**

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>G1 CHECK FOR ON-DEMAND DTCs OR CONTINUOUS MEMORY DTCs</b>	
<ul style="list-style-type: none"> <li>• Carry out the FSSM self-test.</li> <li>• Is DTC B29A1, B29AB, B29A3, or B29AD retrieved as an on-demand DTC during the self-test?</li> </ul>	<p><b>Yes</b> GO to <u>G2</u> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. <ul style="list-style-type: none"> <li>• Disconnect all the FSSM connectors.</li> <li>• Check for:             <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the FSSM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>	<p><b>Yes</b> INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. REPEAT the self-test.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

**Pinpoint Test H: DTCs B299E and B29A8**

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

**Normal Operation**

The Fire Suppression System Module (FSSM) checks all of the fire suppressor circuits for faults. If the FSSM detects a low resistance condition between the LH fire suppressor squib 1 circuits, it stores DTC B299E in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects a low resistance condition between the RH fire suppressor squib 1 circuits, it stores DTC B29A8 in continuous memory and illuminates the fire suppression system indicator.

- DTC B299E (Suppressor Left Circuit Resistance Low on Squib - Loop #1) - sets when the FSSM detects a low resistance condition on the LH fire suppressor squib 1 circuits 2312 and 2313. This DTC causes the fire suppression system indicator to illuminate.
- DTC B29A8 (Suppressor Right Circuit Resistance Low on Squib - Loop #1) - sets when the FSSM detects a low resistance condition on the RH fire suppressor squib 1 circuits 2310 and 2311. This DTC causes the fire suppression system indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- LH fire suppressor
- RH fire suppressor
- FSSM

**PINPOINT TEST H: DTCs B299E AND B29A8**

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>H1 CHECK FOR ON-DEMAND DTCs OR CONTINUOUS MEMORY DTCs</b>	
<ul style="list-style-type: none"> <li>Carry out the FSSM self-test.</li> <li><b>Were DTCs B299E or B29A8 retrieved as on-demand DTCs during the self-test?</b></li> </ul>	<p><b>Yes</b> GO to <u>H2</u> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key in the ignition lock cylinder frequently. REPEAT the self-test.</p>
<b>H2 CHECK THE FSSM</b>	
<ul style="list-style-type: none"> <li>Ignition OFF.</li> <li><b>⚠ WARNING:</b> To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.</li> <li>Disconnect: Negative Battery Cable.</li> <li>Wait approximately 60 seconds to allow the fire suppression system backup power supply to deplete.</li> <li>Disconnect: FSSM C3281a.</li> <li>Measure the resistance between the FSSM C3281a pin 4, component side and the FSSM C3281a pin 5, component side.</li> </ul>	<p><b>Yes</b> For DTC B299E, GO to <u>H3</u> . For DTC B29A8, GO to <u>H4</u> .</p> <p><b>No</b> GO to <u>H7</u> .</p>

N0090291

- Measure the resistance between the FSSM C3281a pin 12, component side and the FSSM C3281a pin 13, component side.

N0090292

- Are the resistances greater than 10,000 ohms?

### H3 CHECK THE LH SUPPRESSOR SQUIB 1 CIRCUITS FOR LOW RESISTANCE

- Connect: FSSM C3281a.
- Disconnect: Inline C339.
- Measure the resistance between the inline C339-3, circuit 2312 (LG), body harness side and the inline C339-4, circuit 2313 (BK/WH), body harness side.

N0013475

- Is the resistance greater than 10,000 ohms?

**Yes**  
GO to H5 .

**No**  
REPAIR circuits 2312 (LG) and 2313 (BK/WH). CONNECT the inline C339. CONNECT the negative battery cable. GO to H6 .

### H4 CHECK THE RH SUPPRESSOR SQUIB 1 CIRCUITS FOR LOW RESISTANCE

- Connect: FSSM C3281a.
- Disconnect: Inline C339.
- Measure the resistance between the inline C339-1, circuit 2310 (OG), body harness side and the inline C339-2, circuit 2311 (DG), body harness side.

**Yes**  
GO to H5 .

**No**  
REPAIR circuits 2310 (OG) and 2311 (DG). CONNECT the inline C339. CONNECT the negative battery cable. GO to H6 .

N0013476

- Is the resistance greater than 10,000 ohms?

**H5 CHECK THE FIRE SUPPRESSORS**

- Disconnect: Suspect Fire Suppressor.
- Connect: Negative Battery Cable.
- **NOTE:** DTCs B299A and B299F are expected to be retrieved when the self-test is carried out with the LH fire suppressor C4317 disconnected. DTCs B29A4 and B29A9 are expected to be retrieved when the self-test is carried out with the RH fire suppressor C4316 disconnected. These DTCs can be cleared once all the fire suppression connections are restored. If DTC B299A, B299F, B29A4, or B29A9 is retrieved with all the fire suppression connections restored, refer to DTC Charts in this section.
- Carry out the FSSM self-test.
- **Is DTC B299E or DTC B29A8 retrieved as an on-demand DTC during the self-test?**

**Yes**

INSTALL a new fire suppression system harness. GO to H6 .

**No**

If DTC B29A8 was retrieved in Step H1, INSTALL a new RH fire suppressor. REFER to Fire Suppressor in this section. GO to H6 .

If DTC B299E was retrieved in Step H1, INSTALL a new LH fire suppressor. REFER to Fire Suppressor in this section. GO to H6 .

**H6 CHECK FOR ADDITIONAL DTCs**

- Refer to the continuous DTCs recorded during Step H1.
- **Were any additional continuous DTCs retrieved during Step H1?**

**Yes**

REFER to DTC Charts in this section.

**No**

CLEAR the DTCs. REPEAT the self-test.

**H7 CHECK FOR CORRECT FSSM OPERATION**

- Disconnect all the FSSM connectors.
- Check for:
  - ◆ corrosion
  - ◆ damaged pins
  - ◆ pushed-out pins
- Connect all the FSSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

**Yes**

INSTALL a new FSSM . REFER to Fire Suppression System Module (FSSM) in this section. REPEAT the self-test.

**No**

The system is operating correctly at this time. The concern may have been caused by a loose or corroded

**Pinpoint Test I: DTC B2792**

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

**Normal Operation**

The Fire Suppression System Module (FSSM) monitors all of the firing loop circuits for a cross-link (short together) between the circuits of another firing loop. If the FSSM detects a short between the circuits of a firing loop and another firing loop (cross-link), it stores DTC B2792 in continuous memory and illuminates the fire suppression system indicator.

- DTC B2792 (Cross Link Between Firing Loops) - sets when the FSSM detects a short between the circuits of 2 different firing loops (cross-link). This DTC causes the fire suppression system indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Short circuit between firing loops
- LH fire suppressor
- RH fire suppressor
- FSSM

**PINPOINT TEST I: DTC B2792 - CROSS LINK BETWEEN FIRING LOOPS**

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors, which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>I1 CHECK FOR ON-DEMAND OR CONTINUOUS MEMORY DTCs</b>

REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. REPEAT the self-test.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded</p>

connector.

**Pinpoint Test J: DTCs B29AF, B29B0, B29B1 and B29B2**

Refer to Wiring Diagrams Cell 96 , Police Option for schematic and connector information.

**Normal Operation**

The Fire Suppression System Module (FSSM) checks the fire suppression manual switch circuits for faults. If the FSSM detects an open or a short to ground on circuit 2315, DTC B29AF is stored in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects a short to voltage on circuit 2315, DTC B29B0 is stored in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects an open or a short to voltage on circuit 2314, DTC B29B1 is stored in continuous memory and illuminates the fire suppression system indicator. If the FSSM detects a short to ground on circuit 2314, DTC B29B2 is stored in continuous memory and illuminates the fire suppression system indicator.

DTC Description	Fault Trigger Conditions
<ul style="list-style-type: none"> <li>B29AF - Fire Suppression Manual Activation Switch High Side Circuit Failure</li> </ul>	Sets when the FSSM detects either an open or a short to ground on circuit 2315. This DTC causes the fire suppression system indicator to illuminate.
<ul style="list-style-type: none"> <li>B29B0 - Fire Suppression Manual Activation Switch High Side Circuit Short to Battery</li> </ul>	Sets when the FSSM detects a short to voltage on circuit 2315. This DTC causes the fire suppression system indicator to illuminate.
<ul style="list-style-type: none"> <li>B29B1 - Fire Suppression Manual Activation Switch Low Side Circuit Failure</li> </ul>	Sets when the FSSM detects either an open or a short to voltage on circuit 2314. This DTC causes the fire suppression system indicator to illuminate.
<ul style="list-style-type: none"> <li>B29B2 - Fire Suppression Manual Activation Switch Low Side Circuit Short to Ground</li> </ul>	Sets when the FSSM detects a short to ground on circuit 2314. This DTC causes the fire suppression system indicator to illuminate.

**This pinpoint test is intended to diagnose the following:**

- Fuse
- Wiring, terminals or connectors
- Fire suppression manual switch
- Fire suppression manual switch wiring harness
- FSSM

**PINPOINT TEST J: DTCs B29AF, B29B0, B29B1 AND B29B2**

**⚠ WARNING:** To reduce the risk of accidental deployment, never probe the connectors on the fire suppressors. Failure to follow this instruction may cause unintentional deployment of the suppressors,

which may result in serious personal injury.

**⚠ WARNING:** To prevent inadvertent deployment of the fire suppression system (FSS), do not defeat, cut or remove wiring connector shorting bars, including when servicing or removing the system. These wiring connectors incorporate shorting bars to reduce the potential for unintended suppressor activation from static electricity charges. Failure to follow this warning may result in serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>J1 CHECK FOR ON-DEMAND OR CONTINUOUS MEMORY DTCs</b>	
<ul style="list-style-type: none"> <li>• Carry out the FSSM self-test.</li> <li>• <b>Is DTC B29AF, B29B0, B29B1, or B29B2 retrieved as an on-demand DTC during the self-test?</b></li> </ul>	<p><b>Yes</b> GO to <u>J2</u> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition lock cylinder frequently. REPEAT the self-test.</p>
<b>J2 CHECK THE FIRE SUPPRESSION MANUAL SWITCH</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING:</b> To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.</li> <li>• Disconnect: Negative Battery Cable.</li> <li>• Wait approximately 60 seconds to allow the fire suppression system backup power supply to deplete.</li> <li>• Disconnect: FSSM C3281a.</li> <li>• Disconnect: Inline C919.</li> <li>• While pressing and releasing the fire suppression manual switch, measure the resistance between the inline connector pins, fire suppression manual switch wiring harness side as follows:</li> </ul>	<p><b>Yes</b> For DTC B29AF, GO to <u>J4</u> . For DTC B29B0, GO to <u>J6</u> . For DTC B29B1, GO to <u>J8</u> . For DTC B29B2, GO to <u>J12</u> .</p> <p><b>No</b> GO to <u>J3</u> .</p>

Switch Position	Measurement	Expected Value
Pressed	Between C919-1 and C919-2	Less than 20 ohms
Released	Between C919-1 and C919-2	Between 1,710 and 1,890 ohms
Pressed	Between C919-3 and C919-4	Less than 20 ohms
Released	Between C919-3 and C919-4	Between 1,710 and 1,890 ohms

- Are the resistance values correct?

### J3 CHECK THE FIRE SUPPRESSION MANUAL SWITCH WIRING HARNESS

- Disconnect: Fire Suppression Manual Switch C9034.
- While pressing then releasing the fire suppression manual switch, measure the resistance between the fire suppression manual switch C9034 pins, component side as follows:

Switch Position	Measurement	Expected Value
Pressed	Between C9034-1 and C9034-2	Less than 20 ohms
Released	Between C9034-1 and C9034-2	Between 1,710 and 1,890 ohms
Pressed	Between C9034-3 and C9034-4	Less than 20 ohms
Released	Between C9034-3 and C9034-4	Between 1,710 and 1,890 ohms

- Are the resistance values correct?

**Yes**  
REPAIR or INSTALL a new fire suppression manual switch wiring harness. GO to **J14**.

**No**  
INSTALL a new fire suppression manual switch. REFER to **Fire Suppression Manual Switch** in this section. GO to **J14**.

### J4 CHECK THE MANUAL SWITCH VOLTAGE SUPPLY

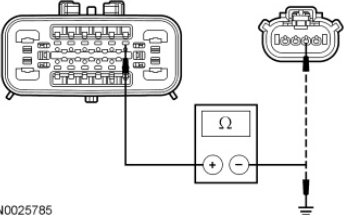

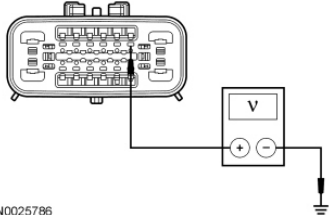

- Connect: Negative Battery Cable.
- Ignition ON.
- Measure the voltage between the inline C919-1, circuit 2319 (RD/YE), body harness side and ground.

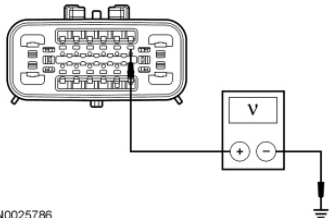

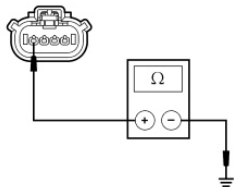

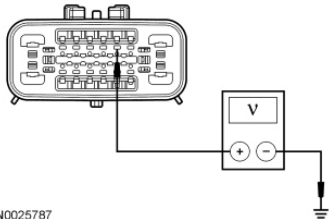

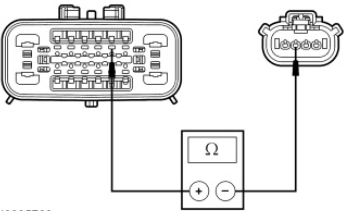

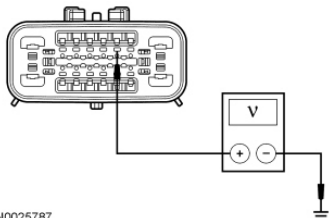

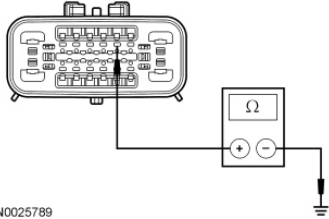

N0013477

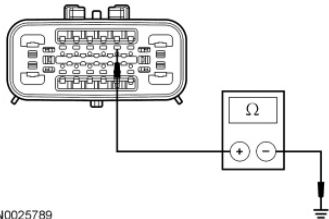

**Yes**  
GO to **J5**.

**No**  
VERIFY the Central Junction Box (CJB) fuse 33 (10A) is OK. If OK, DISCONNECT the negative battery cable. REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CONNECT the inline C919. CONNECT the FSSM C3281a. GO to **J14**.

<ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>

<b>J15 CHECK FOR CORRECT FSSM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the FSSM connectors.</li> <li>• Check for:             <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the FSSM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. REPEAT the self-test.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.</p>

**Pinpoint Test K: DTC B1317**

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

**Normal Operation**

The Fire Suppression System Module (FSSM) monitors the voltage from the battery and sets DTC B1317 in continuous memory and on-demand if the FSSM detects high battery voltage above 18 volts on circuit 2319 or above 17 volts if PCM and ABS messages are not received.

- DTC B1317 (Battery Voltage High) - a continuous memory or on-demand DTC that sets when the FSSM detects battery voltage above 18 volts on circuit 2319 or above 17 volts if PCM and ABS messages are not received.

**This pinpoint test is intended to diagnose the following:**

- Charging system concern
- FSSM

**PINPOINT TEST K: DTC B1317**

**NOTE:** DTC B1317 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
<b>K1 CHECK FOR DTC B1317, B1676 OR P0563 SET IN OTHER MODULES</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: (All CMDTCs) Self-Test.</li> <li>• Retrieve the continuous memory DTCs from all modules.</li> <li>• <b>Is DTC B1317, B1676 or P0563 (PCM) set in more than one module?</b></li> </ul>	<p><b>Yes</b> REFER to <a href="#">Section 414-00</a> to diagnose an overcharging condition.</p> <p><b>No</b> GO to <a href="#">K2</a> .</p>
<b>K2 CHECK THE BATTERY VOLTAGE</b>	
<ul style="list-style-type: none"> <li>• Turn off all interior/exterior lights and accessories.</li> <li>• Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage.</li> <li>• <b>Does the battery voltage rise to 15.5 volts or higher?</b></li> </ul>	<p><b>Yes</b> REFER to <a href="#">Section 414-00</a> to diagnose an overcharging condition.</p> <p><b>No</b> GO to <a href="#">K3</a> .</p>
<b>K3 RECHECK FOR DTC B1317</b>	
<ul style="list-style-type: none"> <li>• Turn the engine off.</li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: FSSM Self-Test.</li> <li>• Clear the continuous memory DTCs.</li> <li>• Carry out the FSSM self-test.</li> <li>• <b>Is DTC B1317 present?</b></li> </ul>	<p><b>Yes</b> INSTALL a new FSSM . REFER to <a href="#">Fire Suppression System Module (FSSM)</a> in this section. TEST the system for normal operation.</p> <p><b>No</b> The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.</p>

**Pinpoint Test L: DTC B1318**

Refer to Wiring Diagrams Cell [13](#) , Power Distribution/SJB for schematic and connector information.

**Normal Operation**

The Fire Suppression System Module (FSSM) monitors the voltage from the battery and sets DTC B1318 in continuous memory and on-demand if the FSSM detects low battery voltage below 9 volts on circuit 2319 or below 9.5 volts if PCM and ABS messages are not received.

- DTC B1318 (Battery Voltage Low) - a continuous memory or on-demand DTC that sets when the FSSM detects battery voltage below 9 volts on circuit 2319 or below 9.5 volts if PCM and ABS messages are not received.

**This pinpoint test is intended to diagnose the following:**

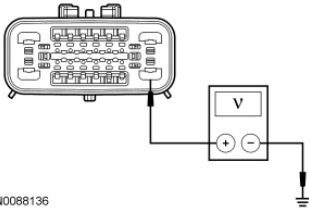

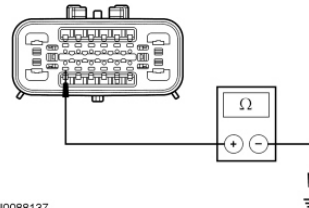

- Wiring, terminals or connectors
- High circuit resistance
- FSSM

**PINPOINT TEST L: DTC B1318**

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to [Section 414-01](#) .

Test Step	Result / Action to Take
<b>L1 RECHECK THE FSSM DTCs</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: FSSM Self-Test.</li> <li>• Clear the DTCs. Repeat the FSSM self-test.</li> <li>• <b>Is DTC B1318 still present?</b></li> </ul>	<p><b>Yes</b> GO to <a href="#">L2</a> .</p> <p><b>No</b> The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.</p>
<b>L2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: PCM Self-Test.</li> <li>• Retrieve the continuous memory DTCs from the PCM.</li> <li>• <b>Is DTC P0620, P0625, P0626 or P065B set in the PCM?</b></li> </ul>	<p><b>Yes</b> REFER to <a href="#">Section 414-00</a> .</p> <p><b>No</b> GO to <a href="#">L3</a> .</p>

<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Check the battery condition and verify the battery is fully charged. Refer to <a href="#">Section 414-01</a> .</li> <li>• <b>Is the battery OK and fully charged?</b></li> </ul>	<p><b>Yes</b> GO to <a href="#">L4</a> .</p> <p><b>No</b> REFER to <a href="#">Section 414-01</a> .</p>
<b>L4 CHECK THE FSSM VOLTAGE SUPPLY</b>	
<ul style="list-style-type: none"> <li>• Measure and record the voltage at the battery.</li> <li>• Disconnect: FSSM C3281A.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between the FSSM C3281A-1, circuit 2319 (RD/YE), harness side and ground.</li> </ul>	<p><b>Yes</b> GO to <a href="#">L5</a> .</p> <p><b>No</b> REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.</p>

 <p>N0088136</p> <ul style="list-style-type: none"> <li>• Is the voltage within 0.2 volt of the recorded battery voltage?</li> </ul>	
<b>L5 CHECK THE FSSM GROUND CIRCUIT</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Negative Battery Cable.</li> <li>• Measure the resistance between the FSSM C3281A-7, circuit 1203 (BK/LB), harness side and ground.</li> </ul>  <p>N0088137</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p><b>Yes</b> GO to <u>L6</u> .</p> <p><b>No</b> REPAIR the circuit for high resistance. TEST the system for normal operation.</p>
<b>L6 CHECK FOR CORRECT FSSM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect the FSSM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect the FSSM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new FSSM . REFER to <u>Fire Suppression System Module (FSSM)</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

## Fire Suppression System Depowering and Repowering

Special Tool(s)

	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
---	---

**⚠ WARNING:** The fire suppression system backup power supply must be depleted before lifting the vehicle or when repairing or replacing any of the following:

- Fire suppression system components
- Components located near the fire suppression manual switch
- Fuel tank and components located near the fuel tank
- Rear axle and components located near the rear axle

To deplete the backup power supply, disconnect the battery and wait at least 1 minute. Be sure to disconnect all auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** If the vehicle is equipped with a fire suppression system, disconnect the battery before anyone gets under the vehicle or near the rear axle area. You could unintentionally deploy the fire suppression system. Failure to follow these instructions may result in serious personal injury.

**NOTE:** If a vehicle equipped with a fire suppression system is positioned on a hoist, the fire suppression system must be depowered.

**NOTE:** The fire suppression system indicator illuminates when the Fire Suppression System Module (FSSM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a fire suppression system fault.

**NOTE:** The fire suppression system must be fully operational and free of faults before releasing the vehicle to the customer.

### Depowering procedure

1. Turn all vehicle accessories off.
2. Turn the ignition lock cylinder to the OFF position.
3. Remove the Central Junction Box (CJB) fuse 33 (10A). For additional information, refer to Wiring Diagrams Cell 96, Police Option for schematic and connector information.

4. Turn the ignition lock cylinder to the ON position and visually monitor the fire suppression system indicator for at least 30 seconds. The fire suppression system indicator will remain lit continuously (no flashing) if the correct FSSM fuse has been removed. If the fire suppression system indicator does not remain lit continuously, remove the correct FSSM fuse before proceeding to the next step.
5. Turn the ignition lock cylinder to the OFF position.
6. **NOTE:** If battery voltage is required for diagnostic procedures, the battery must be connected **without** installing the FSSM fuse.

Disconnect the battery and any auxiliary batteries and power supplies (if equipped) and wait at least one minute. For additional information, refer to Section 414-01 .

### Repowering procedure

7. Install the CJB fuse 33 (10A) to the CJB and close the cover.
8. **NOTE:** This step is not required if the battery was connected after the depowering procedure was carried out.

Connect the battery. For additional information, refer to Section 414-01 .

9. Prove out the fire suppression system as follows:

Turn the ignition lock cylinder from the OFF to the ON position and visually monitor the fire suppression system indicator. The fire suppression system indicator will light continuously for approximately 6 seconds and then turn off. If a fire suppression system fault is present, the fire suppression system indicator will:

- fail to light.
- remain lit continuously.
- flash.

The flashing might not occur until approximately 30 seconds after the ignition lock cylinder has been turned from the OFF to the ON position. This is the time required for the FSSM to complete the testing of the fire suppression system. If this occurs, the fire suppression system fault discovered must be diagnosed and repaired.

Clear all continuous DTCs from the FSSM using a scan tool.

---

**Fire Suppression System Module (FSSM)**

**⚠ WARNING:** Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

**NOTICE:** Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

Item	Part Number	Description
1	N808002	Fire Suppression System Module (FSSM) bolts (4 required)
2	-	FSSM electrical connector (part of 14A005)
3	-	FSSM electrical connector (part of 14C369)
4	19H279	FSSM

**Removal and Installation**

1. **⚠ WARNING:** To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** If the vehicle is equipped with a fire suppression system, disconnect the battery before anyone gets under the vehicle or near the rear axle area. You could unintentionally deploy the fire suppression system. Failure to follow these instructions may result in serious personal injury.

Disconnect the battery. For additional information, refer to [Section 414-01](#).

2. Remove the rear seat cushion pad and frame.
  1. Apply pressure to the lower front portion of the rear seat cushion pad and frame.
  2. Push the rear seat cushion pad and frame rearward to disengage the rear seat cushion front retainers.
3. **⚠ WARNING:** The tightening torque of the fire suppression system module (FSSM) bolts and the FSSM orientation on the body of the vehicle is critical for correct system operation. Always tighten and orient the FSSM per specifications. Failure to do so may result in incorrect fire

**suppression system operation, which increases the risk that it will not protect vehicle occupant(s).**

Remove the 4 bolts and the Fire Suppression System Module (FSSM).

- Disconnect the electrical connectors.
- To install, tighten to 12 Nm (106 lb-in).

4. To install, reverse the removal procedure.

---

## Fire Suppression Manifold

**NOTE:** LH side shown, RH side similar.

Item	Part Number	Description
1	-	Fire suppression manifold bolts (5 required) (part of 19H280/19H281)
2	19H280/19H281	Fire suppression manifold (RH/LH)

### Removal and Installation

1. Remove the fire suppressor. For additional information, refer to Fire Suppressor in this section.
2. Remove and discard the 5 fire suppression manifold bolts.
  - **NOTE:** Apply the threadlock material provided in the new manifold kit when installing the new bolts.

To install, tighten to 3 Nm (27 lb-in).

3. **NOTE:** In the event of a fire suppression system deployment, new fire suppression manifolds must be installed.

Remove the fire suppression manifold.

4. To install, reverse the removal procedure.

**Fire Suppressor**

**⚠ WARNING:** Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

Item	Part Number	Description
1	W505434-S439	Fire suppressor bolts (2 required each side) (or part of 19H339)
2	W520833-S439	No. 4 crossmember J-nuts (2 required each side) (or part of 19H339)
3	N621940-S439	Fire suppressor retainer nuts (2 required) (or part of 19H339)
4	17E954	Fire suppressor retainer (or part of 19H339)
5	-	Fire suppressor electrical connectors (part of 19H339)
6	19H339	Fire suppressor (LH)
7	19H339	Fire suppressor (RH)

**Removal and Installation**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A.
2. **⚠ WARNING:** To reduce the risk of accidental deployment, do not use any memory saver devices when depowering the fire suppression system. Failure to follow this instruction may result in serious personal injury.

Disconnect the battery. For additional information, refer to Section 414-01.

3. Remove the rear suspension lateral arms. For additional information, refer to Section 204-02 .
4. Remove the rear coil springs. For additional information, refer to Section 204-02 .
5. Remove the 2 nuts and the catalytic converter-to-muffler clamp. For additional information, refer to Section 309-00 .
  - To install, tighten to 45 Nm (33 lb-ft).
6. **NOTE:** Check the insulator for wear or damage. Install a new insulator as necessary.

Disconnect the muffler insulator.

7. Remove the tailpipe and muffler assembly.
  - **NOTE:** Check the insulator for wear or damage. Install a new insulator as necessary.

Disconnect the tailpipe insulator.

8. **NOTICE:** Secure the fire suppressor to the transmission jack with a suitable strap.

Support the fire suppressor with a suitable transmission jack.

9. Remove and discard the 2 fire suppressor bolts.
  - To install, tighten to 30 Nm (22 lb-ft).
10. Remove and discard the 2 fire suppressor retainer nuts.
  - To install, tighten to 30 Nm (22 lb-ft).
11. Remove and discard the fire suppressor retainer.
  - Push the tabs to release the retainer from the No. 4 crossmember.
12. **NOTICE:** The fire suppressor electrical connector is located above the No. 4 crossmember. Carefully lower the transmission jack to avoid stressing the fire suppressor wiring harness.

Lower the transmission jack to gain access to the fire suppressor electrical connector.

13. **NOTE:** When connecting the fire suppressor electrical connector, push in the connector until an audible click is heard, then try to disconnect the connector without pressing the locking tab to make sure the connector is fully seated.

Disconnect the fire suppressor electrical connector.

- Push the pin-type retainer to release the fire suppressor connector locator.

14. Remove the fire suppressor.

15. Remove and discard the two No. 4 crossmember J-nuts.

16.  **WARNING: If the vehicle is equipped with a fire suppression system, disconnect the battery before anyone gets under the vehicle or near the rear axle area. You could unintentionally deploy the fire suppression system. Failure to follow these instructions may result in serious personal injury.**

To install, reverse the removal procedure.

---

**Fire Suppression Manual Switch**

Item	Part Number	Description
1	54519A70	Fire suppression manual switch
2	-	Fire suppression manual switch electrical connector (part of 54519A70)
3	14334	Fire suppression manual switch harness

**Removal and Installation**

1. Disconnect the battery. For additional information, refer to [Section 414-01](#).
2. **NOTICE:** Care must be taken when releasing the fire suppression manual switch clips to avoid damaging the switch and the headliner.

Release the fire suppression manual switch from the headliner and position it aside.

3. Position the RH and LH front door weatherstrips aside.
4. Remove the RH and LH windshield side garnish mouldings.
5. Remove the RH and LH sun visors and the center receptacles.
6. **NOTICE:** Care must be taken when lowering the front of the headliner to avoid damaging the headliner.

Lower the front portion of the headliner.

7. Remove the fire suppression manual switch.
  - Disconnect the electrical connector.
8. **NOTICE:** Care must be taken when installing the fire suppression manual switch to avoid folding or pinching the ribbon harness.

To install, reverse the removal procedure.

---

## Maintenance Schedules - Gasoline Engines

The maintenance schedule is designed to protect against major repairs resulting from neglect or inadequate maintenance and to prolong the life of the vehicle.

### General Maintenance Information

**NOTE:** This is a generic maintenance schedule for all Ford, Lincoln and Mercury vehicles. There may be items listed that do not apply to all vehicles.

The Normal Schedule applies to operation of the vehicle under typical, everyday driving conditions. The maintenance frequency in this schedule typifies what the vast majority of vehicles will require. The listed services should be carried out at specified mileage, time or hours of operation, whichever occurs first. There are, however, additional services that only the noted vehicles require.

If the vehicle is operated in one or more of the following special operating conditions, those additional services will be required. The special operating conditions are:

- Towing a trailer or using a camper or car-top carrier.
- Extensive idling and/or low-speed driving for long distances as in heavy commercial use such as delivery, taxi, patrol car or livery.
- Driving in dusty conditions such as unpaved or dusty roads.
- Off-road operation.
- Use of E85 fuel 50% of the time or greater (flex fuel vehicles only).

There are also exceptions to the Normal Schedule which will require more frequent maintenance for some components. Those exceptions are:

- Vehicle axle - maintenance and lubrication.
- Police and taxi vehicles - maintenance and lubrication.
- Engine oil and Motorcraft® Coolant - time-based and mileage-based intervals.
- Change brake fluid every 2 years (Class A Motorhome).
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).
- Change spark plugs every 72,000 km (45,000 mi) (Mustang Shelby GT500).
- Change engine oil and filter every 8,000 km (5,000 mi) (F-150 Raptor).
- Tire rotation every 8,000 km (5,000 mi) (F-150 Raptor).

### Engine Idle Hour Meter - Crown Victoria Police Interceptor, Taxi and Executive Series Town Car Equipped with Engine Idle Hour Meter

The vehicle may be equipped with an engine idle hour meter to indicate how much time the vehicle is idling in PARK or NEUTRAL. The engine idle hour meter is incorporated with the vehicle odometer. Depressing the odometer reset button once will display the trip odometer (miles followed by a T for trip odometer). Depressing the odometer reset button a second time will display the engine idle hour meter (hours followed by an H for hours). The engine idle hour meter will only accumulate time when the vehicle is in PARK or NEUTRAL. Displayed time is cumulative for the vehicle and **the engine idle hour meter cannot be reset to zero**. Emergency vehicles, such as police/fire and fleet vehicles, often experience long periods of idling, during which time the engine oil will continue to break down but mileage is not accumulated on the odometer.

To assist fleet managers in maintaining proper oil change intervals, the engine idle hour meter will help determine when an oil change is required. For every hour that the vehicle idles, it has accumulated the equivalent of approximately 53 km (33 mi) of driving. Using the combination of the vehicle odometer and the engine idle hour meter allows the fleet manager to better determine when the oil needs to be changed.

Engine idle hour meter calculation:

- Idle hours x 33 = miles equivalency
- Miles driven + miles equivalency = oil change interval

Example: In metric units, this calculation would be 4,828 km + 3,233 (61 idle hours x 53 km/idle hour) = 8,061 km. When the odometer has accumulated 3,000 miles + 2,013 (61 hours x 33 miles/idle hour) = 5,013 miles, the oil change interval will have been reached.

### Special Operating Condition Requirements

#### When towing a trailer or using a camper or car-top carrier:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Change automatic transmission fluid (except TorqShift® transmissions) every 48,000 km (30,000 mi). Change automatic transmission filter (except 6F35/6F55/AWF-21) following Normal Schedule.
- Change transfer case fluid every 96,000 km (60,000 mi).
- Change manual transmission fluid every 96,000 km (60,000 mi).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings as required.
- Replace wheel bearing grease and install new grease seals on Rear Wheel Drive (RWD) front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).

#### Extensive idling and/or low speed driving for long distances, as in heavy commercial use such as delivery, taxi, patrol car or livery:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi), 6 months or every 200 hours of engine operation.
- Install a new cabin air filter as required (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Inspect brake system every 8,000 km (5,000 mi).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings every 8,000 km (5,000 mi) or 6 months (if equipped).
- Install a new fuel filter every 24,000 km (15,000 mi) on Crown Victoria, Grand Marquis, Town Car, Mustang, Ranger, F-Super Duty, Expedition EL and Navigator EL (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape, Mariner, F-Series [non-Super Duty] and Transit Connect).
- Change automatic transmission fluid (except TorqShift® transmissions) every 48,000 km (30,000 mi). Change automatic transmission filter (except 6F35/6F55/AWF-21) following Normal Schedule.
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).

## 2010 Crown Victoria, Grand Marquis Workshop Manual

- Install new spark plugs every 96,000 km (60,000 mi).
- Change transfer case fluid every 96,000 km (60,000 mi).

### **When operating in dusty conditions such as unpaved or dusty roads:**

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Install a new cabin air filter as required (if equipped).
- Install a new engine air filter as required.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings every 8,000 km (5,000 mi) or 6 months (if equipped).
- Install a new fuel filter every 24,000 km (15,000 mi) on Crown Victoria, Grand Marquis, Town Car, Mustang, Ranger, F-Super Duty, Expedition EL and Navigator EL (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape, Mariner, F-Series [non-Super Duty] and Transit Connect).
- Change automatic transmission fluid (except TorqShift® transmissions) every 48,000 km (30,000 mi). Change automatic transmission filter (except 6F35/6F55/AWF-21) following Normal Schedule.
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Change manual transmission fluid every 80,000 km (50,000 mi).
- Change rear axle lubricant every 80,000 km (50,000 mi) (E-450 and F-450/550 only).
- Change transfer case fluid every 96,000 km (60,000 mi).

### **When operating in off-road conditions:**

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Install a new cabin air filter as required (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi) or 6 months. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings as required.
- Change automatic transmission fluid (except TorqShift® transmissions) every 48,000 km (30,000 mi). Change automatic transmission filter (except 6F35/6F55/AWF-21) following Normal Schedule.
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Change manual transmission fluid every 80,000 km (50,000 mi).
- Change rear axle lubricant every 80,000 km (50,000 mi) (E-450 and F-450/550 only).
- Change transfer case fluid every 96,000 km (60,000 mi).

### **Use of E85 fuel 50% of the time or greater (flex fuel vehicles only):**

- If run exclusively on E85, fill the fuel tank with a full tank of regular unleaded fuel every 4,800 km (3,000 mi).
- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**When operating a Crown Victoria Police Interceptor, taxi or Town Car-Executive series equipped with an engine idle hour meter:**

- Inspect brake system every 8,000 km (5,000 mi).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for play and noise every 8,000 km (5,000 mi). Vehicles with different front-to-rear tire pressure, the tire pressure must be adjusted and the tire pressure sensor trained.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings every 8,000 km (5,000 mi) or 6 months (if equipped).
- Change engine oil and replace filter every 8,000 km (5,000 mi), 6 months or as indicated by the time/mileage calculation.
- Replace fuel filter every 24,000 km (15,000 mi).
- Change automatic transmission fluid every 48,000 km (30,000 mi).
- Install new spark plugs every 96,000 km (60,000 mi).
- Inspect and replace cabin air filter as required (if equipped).

### **Checks and Services**

Certain basic maintenance checks and inspections should be carried out at specified intervals. Any recognized adverse condition should be corrected as soon as possible.

#### **In-Line, Service-Installed Transmission Fluid Filter (if equipped)**

Some vehicles may be equipped with an in-line, service-installed transmission fluid filter. This filter is installed in the transmission fluid cooler return line. If equipped, install a new in-line filter during transmission fluid change intervals.

#### **Maximum Oil Change Interval (Normal Schedule)**

- 12,000 km (7,500 mi) or 6 months.

#### **Maximum Oil Change Interval (Special Operating Conditions)**

- 8,000 km (5,000 mi), 6 months or 200 hours of engine operation, whichever occurs first.

#### **Engine Coolant Change Interval**

- 6 years or 169,000 km (105,000 mi).
- After initial change: 3 years or 73,000 km (45,000 mi).

### **Multi-Point Inspection**

The following inspections are recommended at every service interval:

- Check and top off fluid levels for brakes, coolant, manual and automatic transmission (if equipped with an underhood fluid level indicator), power steering (if equipped) and window washer fluids.
- Inspect tires for wear and correct air pressure, including spare tire.
- Check exhaust system for leaks, damage, loose parts and foreign material.
- Check battery performance.
- Check operation of horn, exterior lamps, turn signals and hazard warning lights.
- Check radiator, coolers, heater and A/C hoses.
- Inspect windshield wiper spray and wiper operation.

- Check windshield for cracks, chips and pitting.
- Inspect for oil and fluid leaks.
- Inspect halfshaft dust boots (if equipped).
- Check shocks, struts and other suspension components for leaks and damage.
- Inspect steering and linkage.
- Inspect accessory drive belt(s).
- Inspect clutch operation (if equipped).

### Monthly Checks

Check each of the following items every month:

- All interior and exterior lights for correct operation.
- Tires for wear and correct air pressure, including spare tire.
- Engine oil fluid level.
- Windshield washer solvent fluid level.

### Six Month Checks

Check each of the following items at least every 6 months:

- Lap/shoulder belts and seat latches for wear and function.
- External mounted spare tire is stowed correctly (tight to body).
- Power steering fluid level (if equipped).
- Washer spray, wiper operation and clean all wiper blades (install new wiper blades as necessary).
- Parking brake for correct operation.
- Lubricate all hinges, latches, door check straps and outside locks.
- Lubricate upper and lower sliding door tracks (if equipped).
- Clean sliding door contact switches (if equipped).
- Lubricate door rubber weatherstrips.
- Clean body and door drain holes.
- Safety warning lamps (brake, ABS, air bag, safety belt) for correct operation.
- Coolant system fluid level and correct strength.
- Battery connections. Clean if necessary.
- Clutch fluid level, if equipped.

### Retighten Lug Nuts

The following check procedures should be carried out for all cars, minivans, light trucks, sport utilities, vans and Four-Wheel Drive (4WD) vehicles.

- Retighten the wheel nuts to the specified torque at 160 km (100 mi) after any wheel disturbance (tire rotation, changing a flat tire or wheel removal).
- On vehicles equipped with dual rear wheels, retighten the wheel nuts to the specified torque at 160 km (100 mi) and again at 800 km (500 mi) of new vehicle operation or after any wheel disturbance (tire rotation, changing a flat tire or wheel removal).

### Normal Schedule

#### 12,000 km (7,500 mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).

- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**24,000 km (15,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

**36,000 km (22,500 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**48,000 km (30,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter.
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter on Crown Victoria, Grand Marquis, Town Car and Mustang (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus, Focus, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape, Mariner, F-Series [non-Super Duty] and Transit Connect).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.

- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

**60,000 km (37,500 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**72,000 km (45,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

**84,000 km (52,500 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**96,000 km (60,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter.
- Install new climate controlled seat cushion filters (if equipped).

## 2010 Crown Victoria, Grand Marquis Workshop Manual

- Install a new fuel filter on Crown Victoria, Grand Marquis, Town Car and Mustang (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus, Focus, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape, Mariner, F-Series [non-Super Duty] and Transit Connect).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Change automatic transmission fluid and filter on all vehicles equipped with the TorqShift® transmission.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings).
- Inspect brake pads, rotors, brake linings, drums, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

### 108,000 km (67,500 mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

### 120,000 km (75,000 mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect brake pads, rotors, brake linings, drums, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

### 132,000 km (82,500 mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor

training must be done.

**144,000 km (90,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter.
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter on Crown Victoria, Grand Marquis, Town Car and Mustang (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus, Focus, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape, Mariner, F-Series [non-Super Duty] and Transit Connect).
- Install new spark plugs.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect accessory drive belt(s).
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

**156,000 km (97,500 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**168,000 km (105,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Change rear axle fluid on vehicles equipped with DANA axles which use synthetic lubricants.
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.

- Change engine coolant.
- Inspect engine coolant system and hoses.
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

**180,000 km (112,500 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**192,000 km (120,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter.
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter on Crown Victoria, Grand Marquis, Town Car and Mustang (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus, Focus, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape, Mariner, F-Series [non-Super Duty] and Transit Connect).
- Change automatic transmission fluid and filter on all vehicles equipped with the TorqShift® transmission.
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect accessory drive belts.
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

**204,000 km (127,500 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**216,000 km (135,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

**228,000 km (142,500 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Inspect cabin air filter (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

**240,000 km (150,000 mi)**

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter.
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter on Crown Victoria, Grand Marquis, Town Car and Mustang (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus, Focus, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape, Mariner, F-Series [non-Super Duty] and Transit Connect).
- Change automatic transmission fluid and filter (except for 6F35, 6F50, AWF-21, FNR5 and TorqShift® transmissions).
- Change manual transmission fluid (if equipped).
- Change transfer case fluid, 4WD (if equipped).
- Change front differential fluid, 4WD (if equipped).
- Replace rear axle lubricant on all RWD vehicles.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Install new front wheel bearings (if not sealed units).

## 2010 Crown Victoria, Grand Marquis Workshop Manual

- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Change engine coolant.
- Inspect engine cooling system and hoses.
- Install a new accessory drive belt(s) (if a new belt(s) has not been installed within the last 160,000 km [100,000 mi]).
- Inspect exhaust system and heat shields.
- Check the rear spring U-bolt nuts for correct torque every 24,000 km (15,000 mi) (Transit Connect).

### Exceptions To Normal Schedule

#### Maximum Oil Change Interval

- Normal schedule: 12,000 km (7,500 mi) or 6 months, whichever occurs first.
- Special operating conditions: 8,000 km (5,000 mi), 6 months or 200 hours of operation, whichever occurs first.

#### Motorcraft® Coolant

- Change engine coolant at 6 years or 168,000 km (105,000 mi) of the vehicle's life, whichever occurs first.
- After the initial change, change coolant every 3 years or 72,000 km (45,000 mi) thereafter.

#### Normal Vehicle Axle Maintenance

Rear axles and transfer case/Power Transfer Unit (PTU) containing synthetic lubricant and light duty trucks equipped with Ford-design axles are lubricated for life. These lubricants are not to be checked or changed unless service is required, or if a leak is suspected or the axle assembly has been submerged in water.

The axle and transfer case/ PTU fluid should be changed anytime they have been submerged in water. Non-synthetic rear axle lubricants should be installed new every 4,800 km (3,000 mi) or 3 months, whichever occurs first, during extended trailer tow operation above 21°C (70°F) ambient and Wide Open Throttle (WOT) for extended periods above 72 km/h (45 mph).

The 4,800 km (3,000 mi) lube change interval may be waived if the axle was filled with 75W-140 synthetic gear lubricant. Add 118 ml (4 oz) of additive friction modifier for complete refill of Traction-Lok rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

#### Police and Taxi Vehicle Axle Maintenance

Install new rear axle lubricant every 160,000 km (100,000 mi). Rear axle lubricant change may be waived if the axle was filled with 75W-140 synthetic gear lubricant. Add 118 ml (4 oz) of additive friction modifier for complete refill of Traction-Lok rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

#### California Fuel Filter Replacement

If the vehicle is registered in California, the California Air Resources Board has determined that the failure to perform this maintenance item will not nullify the emission warranty or limit recall liability prior to the completion of the vehicle's useful life. Ford Motor Company, however, urges you to have all recommended maintenance services performed at the specified intervals and to record all vehicle service.

**F-150 Raptor (See Maintenance Schedule - SVT Raptor)**

- Every 8,000 km (5,000 mi) change oil and filter.
- Every 8,000 km (5,000 mi) rotate tires.

**Mustang Shelby GT500**

- Every 8,000 km (5,000 mi) rotate tires.
  - Every 72,000 km (45,000 mi) replace spark plugs.
-

**Noise, Vibration and Harshness (NVH)**

Noise is any undesirable sound, usually unpleasant in nature. Vibration is any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down. Harshness is a ride quality issue where the vehicle's response to the road transmits sharply to the customer. Harshness normally describes a firmer than usual response from the suspension system. NVH is a term used to describe these conditions, which result in varying degrees of dissatisfaction. Although a certain level of NVH caused by road and environmental conditions is normal, this section is designed to aid in the diagnosis, testing and repair of NVH symptoms.

**Acceptable NVH**

All internal combustion engines and drivelines produce some noise and vibration; operating in a real world environment adds noise that is not subject to control. Vibration isolators, mufflers and dampers reduce these to acceptable levels. A driver who is unfamiliar with a vehicle can think that some sounds are abnormal when actually the sounds are normal for the vehicle type. As a technician, it is very important to be familiar with vehicle features and know how they relate to NVH symptoms and their diagnosis. For example, if the vehicle has automatic overdrive, it is important to test drive the vehicle both in and out of overdrive mode.

**Glossary of Terms****Amplitude**

The quantity or amount of energy produced by a vibrating component (G-force). An extreme vibration has a high amplitude. A mild vibration has a low amplitude. See Intensity.

**Boom**

Low frequency or low pitched noise often accompanied by a vibration. Also refer to Drumming.

**Buffet/Buffering**

Strong noise fluctuations caused by gusting winds. An example would be wind gusts against the side glass.

**Buzz**

A low-pitched sound like that from a bee. Often a metallic or hard plastic humming sound. Also describes a high-frequency vibration. Vibration feels similar to an electric razor.

**Chatter**

A pronounced series of rapidly repeating rattling or clicking sounds.

**Chirp**

A short-duration, high-pitched noise associated with a slipping drive belt.

**Chuckle**

A repetitious, low-pitched sound. A loud chuckle is usually described as a knock.

**Click**

A sharp, brief, non-resonant sound, similar to actuating a ball point pen.

**Clonk**

A hydraulic knocking sound. Sound occurs with air pockets in a hydraulic system. Also described as hammering.

**Clunk/Driveline Clunk**

A heavy or dull, short-duration, low-frequency sound. Occurs mostly on a vehicle that is accelerating or decelerating abruptly. Also described as a thunk.

**Conductor**

The components that carry (transmit) a vibration frequency from the originator to the reactor.

**Cycles Per Second**

Cycles per second. Same as hertz (Hz).

**Cracks**

A mid-frequency sound, related to squeak. Sound varies with temperature conditions.

**Creak**

A metallic squeak.

**Cycle**

The process of a vibrating component going through a complete range of motion and returning to the starting point.

**Decibel (dB)**

A unit of measurement, referring to sound pressure level, abbreviated dB.

**Drone**

A low-frequency, steady sound, like a freezer compressor. Also described as a moan.

**Drumming**

A cycling, low-frequency, rhythmic noise often accompanied by a sensation of pressure on the ear drums. Also described as a low rumble, boom or rolling thunder.

**Flutter**

Mid to high intermittent sound due to air flow. Similar to a flag flapping in the wind.

**Frequency**

The rate at which a cycle occurs within a given time.

**G-force**

The additional load or weight produced in an object during acceleration. When measuring the level or amplitude of a vibration without sound, the unit G is added to associate the force of the vibration to gravity. This is similar to measuring the weight of an object, which is also a function of gravity.

**Gravelly Feel**

A grinding or growl in a component, similar to the feel experienced when driving on gravel.

**Grind**

An abrasive sound, similar to using a grinding wheel, or rubbing sand paper against wood.

**Hertz (Hz)**

A unit of measure used to describe noise and vibration concerns expressed in cycles per second.

**Hiss**

Steady, high-frequency noise. Vacuum leak sound.

**Hoot**

A steady, low-frequency tone, sounds like blowing over a long neck bottle.

**Howl**

A mid-range frequency noise between drumming and whine. Also described as a hum.

**Hum**

Mid-frequency steady sound, like a small fan motor. Also described as a howl.

**Intensity**

The physical quality of sound that relates to the strength of the vibration (measured in decibels). The higher the sound's amplitude, the higher the intensity and vice versa. See Amplitude.

**Knock**

A heavy, loud, repetitious sound, like a knock on the door.

**Moan**

A constant, low-frequency tone. Also described as a hum.

**Ping**

A short-duration, high-frequency sound, which has a slight echo.

**Pitch**

The physical quality of sound that relates to its frequency. Pitch increases as frequency increases and vice versa.

**Pumping Feel**

A slow, pulsing movement.

**Rattle**

A random and momentary or short-duration noise.

**Reactor**

The component, or part, that receives a vibration from an originator and conductor and reacts to the vibration by moving.

**Roughness**

A medium-frequency vibration. A slightly higher frequency than a shake. This type of vibration is usually related to drivetrain components.

**Rustling**

Intermittent sound of varying frequency, sounds similar to shuffling through leaves.

**Shake**

A low-frequency vibration, usually with visible component movement. Usually relates to tires, wheels, brake drums or brake discs if it is vehicle speed sensitive, or engine if it is engine speed sensitive. Also referred to as a shimmy or wobble.

**Shimmy**

An abnormal vibration or wobbling, felt as a side-to-side motion of the steering wheel in the driveshaft rotation. Also described as waddle.

**Shudder**

A low-frequency vibration that is felt through the steering wheel or seat during light brake application.

**Slap**

A resonance from flat surfaces, such as safety belt webbing or door trim panels.

**Squeak**

A high-pitched transient sound, similar to rubbing fingers against a clean window.

**Squeal**

A long-duration, high-pitched noise.

**Tap**

A light, rhythmic or intermittent hammering sound, similar to tapping a pencil on a table edge.

**Thump**

A dull beat caused by 2 items striking together.

**Tick**

A rhythmic tap, similar to a clock noise.

**Tip-In Moan**

A light moaning noise heard during light vehicle acceleration, usually between 40-100 km/h (25-65 mph).

**Transient**

A noise or vibration that is momentary, a short duration.

**Vibration**

Any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down.

**Whine**

A constant, high-pitched noise. Also described as a screech.

**Whistle**

High-pitched noise with a very narrow frequency band. Examples of whistle noises are a turbocharger or air flow around an antenna.

**Wind Noise**

Any noise caused by air movement in, out or around the vehicle.

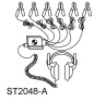

---

**Noise, Vibration and Harshness (NVH)**

## Special Tool(s)

	Electronic Vibration Analyzer (EVA) 100-F027 (014-00344) or equivalent
	EngineEAR 107-R2100 or equivalent
	EngineEAR/ChassisEAR 107-R2102 or equivalent
	Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) 257-00018 or equivalent
	Squeak and Rattle Repair Kit 164-R4900
	Ultrasonic Leak Detector 134-R0135 or equivalent

**Diagnostic Theory**

**⚠ WARNING:** If equipped with fire suppression system, refer to Section 100-02B for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

The shortest route to an accurate diagnosis results from:

- system knowledge, including comparison with a known good system.
- system history, including repair history and usage patterns.
- condition history, especially any relationship to repairs or sudden change.
- knowledge of possible sources.
- using a systematic diagnostic method that divides the system into related areas.

The diagnosis and correction of NVH symptoms requires:

- a road or system test to determine the exact nature of the symptom.
- an analysis of the possible causes.
- testing to verify the cause.
- repairing any symptoms found.
- a road test or system test to make sure the cause has been corrected or brought back to within an acceptable range.

## Diagnostic Procedure Overview

Qualifying the symptom by the particular sensation present can help narrow down the cause. Always use the "symptom" to "system" to "component" to "cause" diagnosis technique. This diagnostic method divides the problem into related areas to correct the customer concern.

- Verify the "symptom".
- Determine which "system(s)" can cause the "symptom" using the diagnostic tools described in this section.
- After determining the possible "system(s)", refer to the appropriate section in this manual to identify the worn or damaged "components".
- After identifying the "components", identify the "cause" of the failure.

## Tools and Techniques

The diagnostic tools allow for a systematic collection of information that is necessary to accurately diagnose and repair NVH problems. Remember that the vibrating source component (originator) may only generate a small vibration. This small vibration can in turn cause a larger vibration/noise to emanate from another receiving component (reactor), due to contact with other components (transfer path). For the best results, carry out the test as follows:

- a. Test drive the vehicle with the vibration sensor inside the vehicle.
- b. Place the sensor in the vehicle according to feel.
  - ◆ If the condition is felt through the steering wheel, the source is most likely in the front of the vehicle.
  - ◆ A vibration that is felt in the seat or floor only will most likely be found in the driveline, drive axle or rear wheels and tires.
- c. Record the readings. Also note when the condition begins, when it reaches maximum intensity and if it tends to diminish above/below a certain speed.
  - ◆ If a vibration symptom is vehicle speed related, the tire and wheel rpm/frequency and driveshaft frequency should be calculated.
  - ◆ If a vibration symptom is engine speed related, the engine, engine accessory and engine firing frequencies should be calculated.
  - ◆ Frequencies with an amplitude reading of 0.06 Gs or less are barely perceptible NVH levels. No corrective action is necessary.
- d. Place the vibration sensor on or near the suspect area outside the vehicle.
- e. Continue the road test, driving the vehicle at the speed the symptom occurs, and take another reading.
- f. Compare the readings.
  - ◆ A match in frequency indicates the problem component or area.
  - ◆ An unmatched test could indicate the symptom is caused by the engine, torque converter or engine accessory. Use the diagnostic tools in the rpm mode and check if the symptom is rpm related.

The following diagnostic tools and techniques can be used separately or in conjunction with each other to aid in the diagnosis of NVH symptoms. They are listed in order of preference for ease in their use for locating these symptoms.

### NVH Analyzer (Vetronix)

The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) and the MTS 4100 NVH analyzers are tools to aid in the identification and isolation of a noise, vibration or harshness symptom in a vehicle. They measure noise and vibration data and compare it with data obtained from the vehicle's PCM as well as vehicle variants that were entered by the user such as pulley size, axle ratio and tire size in order to provide possible sources. The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer

(Vetronix) and the MTS 4100 have the following characteristics:

- Interface with the vehicle computer system
- Support and store vibration data input from 1 or 2 accelerometers
- Support and store noise data input from 2 microphones
- Provide a photo-tachometer for operation of the driveshaft balancing function
- Provide a strobe output capable of driving a standard timing light
- Contain a real-time clock circuit that provides time and date information which is used for tagging test data
- Have the capability to print to an external printer and interface with a PC
- Can be powered from a variety of power sources: cigarette lighter, AC power or the internal battery pack

The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) and the MTS 4100 NVH analyzers have 4 main operating modes. The first is for vibration diagnosis. This mode measures data from 1 or 2 accelerometers simultaneously while obtaining data from the vehicle. Then it carries out a frequency analysis on the accelerometer information and compares the vibration frequencies with the frequencies associated with various rotating components within the vehicle. The data can be presented in 4 different display modes: principle component, bar chart, frequency spectrum or waterfall. All display mode formats contain the same common elements, such as amplitude.

The second is for noise diagnosis. This mode measures noise from 1 or 2 microphones simultaneously. All noise measurements are in decibels (dBs). All frequency bands used for noise measurements are the same as for the vibration measurements, up to 1,000 Hz.

The third is driveshaft balancing. Driveshaft balancing is done using 1 or 2 accelerometers and a photo-tachometer. The accelerometers measure the vibration at both ends of the driveshaft, while the photo-tachometer measures the rotation speed and position reference. Refer to [Section 205-00](#).

The fourth is the strobe. A strobe or standard timing light can be connected to an analyzer, to provide a means for measuring rotation speed. The strobe function is used for isolating the source of a vibration.

### Electronic Vibration Analyzer (EVA)

The Electronic Vibration Analyzer (EVA) is a hand-held electronic scan tool which will assist in locating the source of unacceptable vibrations. The vibration sensor can be remotely mounted anywhere in the vehicle for testing purposes. The unit displays the 3 most common vibration frequencies and their corresponding amplitudes simultaneously. A bar graph provides a visual reference of the relative signal strength (amplitude) of each vibration being displayed and its relative G-force. The keypad is arranged to make the EVA simple to program and use. Some of the functions include the ability to average readings as well as record, play back and freeze readings. The EVA has a strobe balancing function that can be used to detect imbalance on rotating components such as a driveshaft or engine accessories.

Item	Description
1	Electronic Vibration Analyzer (EVA) screen

2	Frequency mode displayed in rpm or Hz
3	Active sensor input (A or B)
4	Current active mode
5	G-force indicators or the strongest frequencies in descending strength of each vibration
6	Strength of each vibration
7	Frequency in rpm/Hz of each vibration

Record the readings taken with the diagnostic tool.

- ◆ Frequencies should be read in the "average" mode.
- ◆ Frequencies have a range of plus or minus 2 Hz. A reading of 10 Hz can be displayed as an 8 Hz through 12 Hz.

### **Vibrate Software®**

Vibrate Software® (Rotunda tool number 215-00003) is a diagnostic aid which will assist in pinpointing the source of unacceptable vibrations. The engine's crankshaft is the point of reference for vibration diagnosis. Every rotating component will have an angular velocity that is faster, slower or the same as the engine's crankshaft. Vibrate Software® calculates the angular velocity of each component and graphically represents these velocities on a computer screen and on a printed vibration worksheet. The following steps outline how Vibrate Software® helps diagnose a vibration symptom:

- Enter the vehicle information. Vibrate will do all the calculations and display a graph showing tire, driveshaft and engine vibrations.
- Print a Vibration Worksheet graph. The printed graph is to be used during the road test.
- Road test the vehicle at the speed where the vibration is most noticeable. Record the vibration frequency rpm and the engine rpm on the worksheet graph. The point on the graph where the vibration frequency rpm reading and the engine rpm reading intersect indicates the specific component group causing the symptom.
  - ◆ A frequency measurement tool capable of measuring vibration frequency and engine rpm will be needed.
- Provides graphics of diagnostic procedures to aid in testing components.

### **Reed Tachometer**

The Reed tachometer is a hand-held vibration sensor which will assist in locating the source of unacceptable vibrations. The vibration sensor can be placed anywhere in the vehicle for testing purposes. The Reed tachometer contains several reeds that are tuned to vibrate or resonate at different frequencies ranging from 10 to 80 Hz or 600 to 4,800 rpm. Though the Reed tachometer is able to measure multiple frequencies, it does not measure amplitude.

### **Sirometer**

The Sirometer measures frequency in hertz and rpm. To use the Sirometer, place it on any vibrating component and slowly scroll the wire out by turning the knob. As the length of wire changes, so does its natural frequency. Find the length of wire that vibrates with the highest amplitude. This frequency will match that of the vibrating component. Read the frequency for that length of wire.

### **Combination EngineEAR/ChassisEAR**

An electronic listening device used to quickly identify noise and the location under the chassis while the vehicle is being road tested. The EngineEAR/ChassisEAR can identify the noise and location of damaged/worn wheel bearings, CV joints, brakes, springs, axle bearings or driveshaft carrier bearings.

### **EngineEAR Basic Unit**

An electronic listening device used to detect even the faintest noises. The EngineEARs can detect the noise of damaged/worn bearings in generators, coolant pumps, A/C compressors and power steering pumps. They are also used to identify noisy lifters, exhaust manifold leaks, chipped gear teeth and for detecting wind noise. The EngineEAR has a sensing tip, amplifier and headphones. The directional sensing tip is used to listen to the various components. Point the sensing tip at the suspect component and adjust the volume with the amplifier. Placing the tip in direct contact with a component will reveal structure-borne noise and vibrations, generated by or passing through, the component. Various volume levels can reveal different sounds.

### **Mechanic's Stethoscope**

A mechanic's stethoscope is an inexpensive tool for locating noises in engines and other moving parts. It can be used to help diagnose piston slap, worn gears, faulty valves, coolant pump failure, damaged gaskets, defective bearings and body squeaks.

### **Squeak and Rattle Repair Kit**

The Squeak and Rattle Repair Kit (Rotunda tool number 164-R4900) contains lubricants and self-adhesive materials that can be used to eliminate interior and exterior squeaks and rattles. The kit consists of the following materials:

- PVC (soft foam) tape
- Urethane (hard foam) tape
- Flocked (black fuzzy) tape
- UHMW (frosted) tape
- Squeak and rattle oil tube
- Squeak and rattle grease tube

### **Ultrasonic Leak Detector**

The Ultrasonic Leak Detector is used to detect wind noises caused by leaks and gaps in areas where there is weatherstripping or other sealing material. It is also used to identify A/C leaks, vacuum leaks and evaporative emission noises. The Ultrasonic Leak Detector includes a multi-directional transmitter (operating in the ultrasonic range) and a hand-held detector. The transmitter is placed inside the vehicle. On the outside of the vehicle, the hand-held detector is used to sweep the area of the suspected leak. As the source of the leak is approached, a beeping sound is produced which increases in both speed and frequency.

### **Write-Up Job Aid**

To assist the service advisor and the technician, a Write-Up Job Aid used during the interview process is included with this material. The Write-Up Job Aid serves as a place to record all important symptom information.

Ford		"WRITE-UP" JOB AID				REPAIR ORDER # _____ CUSTOMER CONCERN # _____			
<b>SPECIFIC SENSE IDENTIFICATION AND LOCATION ON VEHICLE OF CUSTOMER SYMPTOM(S)</b> INSTRUCTIONS: Check below sense affected and location of concern on the generic vehicle illustration (darken the vehicle area). Plus circle appropriate responses to the right.  NOTE: Shaded backgrounds indicate caution areas. Selection of two or more caution areas "flag" difficult repairs in general, shaded areas are the more difficult to verify and repair, and require all applicable columns to be completed.		<b>VEHICLE SYMPTOM AREA</b>	<b>HOW OFTEN?</b>	<b>VEHICLE OPERATING MODE</b>	<b>VEHICLE CONDITIONS</b>	<b>VEHICLE SPEED(mph)</b>	<b>WHEN VEHICLE IS?</b>	<b>AMBIENT CONDITION</b>

## 1: Customer Interview

The diagnostic process starts with the customer interview. The service advisor must obtain as much information as possible about the symptom and take a test drive with the customer. There are many ways a customer will describe NVH symptoms and this will help minimize confusion arising from descriptive language differences. It is important that the symptom is correctly interpreted and the customer descriptions are recorded. During the interview, complete the Write-Up Job Aid and ask the following questions:

- When was it first noticed?
- Did it appear suddenly or gradually?
- Did any abnormal occurrence coincide with or precede its appearance?

Use the information gained from the customer to accurately begin the diagnostic process.

## 2: Pre-Drive Check

It is important to do a pre-drive check before road testing the vehicle. A pre-drive check verifies that the vehicle is relatively safe to drive and eliminates any obvious faults on the vehicle.

The pre-drive check consists of a brief visual inspection. During this brief inspection, take note of anything that will compromise safety during the road test and make those repairs/adjustments before taking the vehicle on the road.

## 3: Preparing for the Road Test

Observe the following when preparing for the road test:

- Review the information recorded on the Write-Up Job Aid. It is important to know the specific symptom the customer has with the vehicle.
- Do not be misled by the reported location of the noise/vibration. The cause can actually be some

distance away.

- Conduct the road test on a quiet street where it is safe to duplicate the noise/vibration. The ideal testing route is an open, low-traffic area where it is possible to operate the vehicle at the speed in which the condition occurs.
- While observing that they are not related to the symptom, eliminate the following:
  - ◆ If possible, lower the radio antenna in order to minimize turbulence.
  - ◆ Identify anything that could potentially make noise or be a source of wind noise.
  - ◆ Inspect the vehicle for add-on items that create noise/vibration.
  - ◆ Turn off the radio and the heating and cooling system blower.
- The engine speed is an important factor in arriving at a final conclusion. Therefore, connect a diagnostic tool, Vetronix, or an accurate tachometer to the engine, even if the vehicle has a tachometer. This will make sure of an exact engine speed reading.

#### 4: Verify the Customer Concern

Verify the customer concern by carrying out a road test, an engine run-up test or both.

The decision to carry out a road test, an engine run-up test or both depends on the type of NVH symptom. A road test may be necessary if the symptom relates to the suspension system or is sensitive to torque. A Drive Engine Run-Up (DERU) or a Neutral Engine Run-Up (NERU) test identifies noises and vibrations relating to engine and drivetrain rpm. Remember, a condition will not always be identifiable by carrying out these tests, however, they will eliminate many possibilities if carried out correctly.

#### 5: Road Test

**NOTE:** It may be necessary to have the customer ride along or drive the vehicle to point out the symptom. During the road test, take into consideration the customer's driving habits and the driving conditions. The customer's concern just may be an acceptable operating condition for that vehicle.

The following is a brief overview of each test in the order in which it appears. A review of this information helps to quickly identify the most appropriate process necessary to make a successful diagnosis. After reviewing this information, select and carry out the appropriate test(s), proceeding to the next step of this process.

- The Slow Acceleration Test is normally the first test to carry out when identifying an NVH symptom, especially when a road test with the customer is not possible.
- The Heavy Acceleration Test helps to determine if the symptom is torque-related.
- The Neutral Coast Down Speed Test helps to determine if the symptom is vehicle speed-related.
- The Downshift Speed Test helps to determine if the symptom is engine speed-related.
- The Steering Input Test helps to determine how the wheel bearings and other suspension components contribute to a vehicle speed-related symptom.
- The Brake Test helps to identify vibrations or noise that are brake related.
- The Road Test Over Bumps helps isolate a noise that occurs when driving over a rough or bumpy surface.
- The Engine Run-Up Tests consist of the Neutral Engine Run-Up (NERU) Test and the Drive Engine Run-Up (DERU) Engine Load Test. These tests help to determine if the symptom is engine speed-related.
- The Neutral Engine Run-Up (NERU) Test is used as a follow-up test to the Downshift Speed Test when the symptom occurs at idle.
- The Drive Engine Run-Up (DERU) Load Test helps to identify vibration/noise sensitive to engine load or torque. It also helps to reproduce engine speed-related symptoms that cannot be duplicated when carrying out the Neutral Engine Run-Up (NERU) Test or the Neutral Coast Down Test.

- The Engine Accessory Test helps to locate faulty belts and accessories that cause engine speed-related symptoms.
- The Vehicle Cold Soak Procedure helps to identify symptoms occurring during initial start-up and when an extended time lapse occurs between vehicle usage.

### **Slow Acceleration Test**

To carry out this test, proceed as follows:

- Slowly accelerate to the speed where the reported symptom occurs. Note the vehicle speed, the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify from what part of the vehicle the symptom is coming.
- Attempt to identify the source of the symptom.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Heavy Acceleration Test**

To carry out this test, proceed as follows:

- Accelerate hard from 0-64 km/h (0-40 mph).
- Decelerate in a lower gear.
- The symptom is torque related if duplicated while carrying out this test.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Neutral Coast Down Speed Test**

To carry out this test, proceed as follows:

- Drive at a higher rate of speed than where the symptom occurred when carrying out the Slow Acceleration Test.
- Place the transmission in NEUTRAL and coast down past the speed where the symptom occurs.
- The symptom is vehicle speed-related if duplicated while carrying out this test. This eliminates the engine and the torque converter as sources.
- If the symptom was not duplicated while carrying out this test, carry out the Downshift Speed Test to verify if the symptom is engine speed related.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Downshift Speed Test**

To carry out this test, proceed as follows:

- Shift into a lower gear than the gear used when carrying out the Slow Acceleration Test.
- Drive at the engine rpm where the symptom occurs.
- The symptom is engine speed related if duplicated while carrying out this test. This eliminates the

tires, wheels, brakes and the suspension components as sources.

- If necessary, repeat this test using other gears and neutral to verify the results.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Steering Input Test**

To carry out this test, proceed as follows:

- Drive at the speed where the symptom occurs, while making sweeping turns in both directions.
- If the symptom goes away or gets worse, the wheel bearings, hubs, U-joints (contained in the axles of Four-Wheel Drive (4WD) applications), and tire tread wear are all possible sources.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Brake Test**

To carry out this test, proceed as follows:

- With the brake released, accelerate the vehicle. While coasting (brake pedal released) to a stop in NEUTRAL, note any abnormal rate of deceleration. Abnormal deceleration could indicate a parking brake or service brake that is not fully releasing.
- Warm the brakes by slowing the vehicle a few times from 80-32 km/h (50-20 mph) using light braking applications.
- Accelerate to 89-97 km/h (55-60 mph). Moderately apply the brakes and slow the vehicle to a stop.
- A brake vibration can be felt in the steering wheel, seat or brake pedal. A brake noise can be heard upon brake application and should diminish when the brake is released. For vehicles with separate park brake shoes, noise or vibration from the parking brake system will not be affected by applying the hydraulic brakes. On these systems, the parking brake system requires inspection if a parking brake concern is suspected.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate brake section(s) for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Road Test Over Bumps**

To carry out this test, proceed as follows:

- Drive the vehicle over a bump or rough surface one wheel at a time to determine if the noise is coming from the front or the back and the left or the right side of the vehicle.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Neutral Engine Run-Up (NERU) Test**

To carry out this test, proceed as follows:

- Install a tachometer.
- Increase the engine rpm up from an idle to approximately 4,000 rpm while in PARK on Front Wheel Drive (FWD) vehicles with automatic transmissions, or NEUTRAL for all other vehicles. Note the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify what part of the vehicle the symptom is coming from.
- Attempt to identify the source of the symptom.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### Drive Engine Run-Up (DERU) Load Test

To carry out this test, proceed as follows:

**⚠ WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

**NOTICE: Do not carry out the Drive Engine Run-Up (DERU) Load Test for more than 5 seconds or damage to the transmission or transaxle may result.**

- Block the front and rear wheels.
- Apply the parking brake and the service brake.
- Install a tachometer.
- Shift the transmission into DRIVE, and increase and decrease the engine rpm between an idle to approximately 2,000 rpm. Note the engine rpm and, if possible, determine the vibration frequency.
- Repeat the test in REVERSE.
- If the vibration/noise is duplicated when carrying out this test, inspect the engine and transmission or transaxle mounts.
- If the symptom is definitely engine speed-related, carry out the Engine Accessory Test to narrow down the source.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### Engine Accessory Test

To carry out this test, proceed as follows:

**⚠ WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

**NOTICE: Limit engine running time to one minute or less with belts removed or serious engine damage will result.**

**NOTE:** Use a frequency measurement tool to pinpoint accessory vibrations. A listening device, such as an EngineEAR, will also help to identify noises from specific accessories.

- Remove the accessory drive belt(s).
- Increase the engine rpm to where the symptom occurs.
- If the noise/vibration is duplicated when carrying out this test, the belt(s) and accessories are not

sources.

- If the noise/vibration was not duplicated when carrying out this test, install the accessory belt(s), one at a time, to locate the source.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Vehicle Cold Soak Procedure**

To carry out this procedure, proceed as follows:

- Test preparations include matching customer conditions (if known). If not known, document the test conditions: gear selection and engine rpm. Monitor the noise/vibration duration with a watch for up to 3 minutes.
- Park the vehicle where testing will occur. The vehicle must remain at or below the symptom temperature (if known) for 6-8 hours.
- Before starting the engine, conduct a visual inspection under the hood.
- Turn the key ON, but do not start the engine. Listen for the fuel pump, ABS and air suspension system noises.
- Start the engine.
- Isolate the noise/vibration by carefully listening. Move around the vehicle while listening to find the general location of the noise/vibration. Then, search for a more precise location by using a stethoscope or EngineEAR.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

### **Classify NVH Symptom**

For NVH concerns, it is necessary to classify the customer's concern into one of the 3 categories: noise, vibration or harshness. The reason for this is that a customer concern may consist of a combination of symptoms involving noise and vibration, or vibration and harshness. In cases where there are combination symptoms, the technician needs to know which diagnostic path to follow: noise, vibration or harshness. For example, if a customer has a concern involving a noise and a vibration, and it is determined that it is vehicle speed-related, the vibration diagnostic path would be followed.

### **Noise Symptoms**

Once a symptom is classified as a noise, the particular conditions under which the noise occurs need to be identified. These conditions are identified and verified during the road test. For example, a noise may only occur while turning. The next step is to determine which systems on the vehicle are related to that condition. In this case, the steering system and wheel/tire system may be suspect. After identifying possible systems, a preliminary inspection of these systems should be done. If the source of noise is still unidentified, use a listening device (such as the EngineEAR/ChassisEAR) to pinpoint the source. Once the source has been identified, determine if this source is related to the suspected system previously identified. If it is related, then complete the repair to resolve the customer concern. If it is unrelated, then it is possible that the source of the noise is a reactor to a noise being transmitted through a transfer path. If this is the case, repairing the reactor will not resolve the customer concern. The transfer path must be identified and a determination made if the noise is normal, but accentuated by the transfer path (conductor), or if the originator is the fault causing excessive noise to transfer to another component through a conductor. There is a relationship between systems identified as related to conditions and the noise transfer path. In some cases, the condition under which the

noise occurs has nothing to do with the identified source. This relationship is important in the diagnosis of noise concerns. It is the first clue that the identified source of noise might be a reactor and that further investigation is needed to diagnose a possible noise transfer path concern. Based on the results from the road test, make a determination of which action in the Symptom Chart to take first.

## Vibration Symptoms

Most vibrations consist of movements back and forth or up and down that repeat. Every time the vibrating component goes through its complete range of motion and returns to the starting point is called a cycle. The rate at which these cycles occur within a given time is called the frequency. Frequency is measured in cycles per second or Hertz (Hz). One cycle per second equals one Hz. Once the frequency of a vibration is known, calculations can be done to determine the system that is the source of the concern.

## Order of Vibration

The order of a vibration refers to how often the vibration is present in one revolution of the component. For example, a vibration that is present once each revolution of a component would be a first order vibration. A vibration present twice each revolution of the component would be a second order vibration. Vibration orders do not have to be whole numbers, they can have decimal values such as 1.5 order vibration or 3.08 order vibration.

The concept of order of vibration is important to remember when the measured frequency of a vibration does not seem to match the frequency calculations of any of the likely systems or components. As the order increases, the frequency of the vibration will also increase by a multiple of that number.

For example, vibration may be present where the frequency is measured at 14 Hz. After doing the necessary calculations, it is determined the first order tire and wheel frequency is 7 Hz and the first order driveshaft frequency is 22 Hz. Based on this information, it can be determined the vibration is most likely a second order tire and wheel vibration: 7 Hz (first order tire and wheel frequency) multiplied by 2 (second order) equals 14 Hz (second order tire and wheel frequency).

## Relationship of Vibration Frequency to Order of Vibration

After carrying out the road test as described in this section, the vibration was determined to be either vehicle-speed related or engine-speed related. That determination will identify the vibration frequency calculations that should be done.

Vibration Type	Calculate
Vehicle-speed related	Tire-speed vibration frequency
	Driveshaft-speed vibration frequency
Engine-speed related	Engine vibration frequency
	Engine accessory vibration frequency
	Engine firing vibration frequency

In calculating and using frequency readings, it is important to remember the direct relationship between Hz and rpm. One Hz is equal to 60 rpm. This is easy to remember by thinking of Hz as cycles per second. There

are 60 seconds in a minute, therefore multiply the Hz reading by 60 to get rpm. Conversely, rpm would be divided by 60 to get Hz.

Use the Frequency and RPM Calculations Worksheet to calculate system/component frequencies. The worksheet provides the necessary steps to determine each system/component group frequency.

## Frequency Calculations

### Calculating Tire and Wheel Frequency

For a vibration concern, use the vehicle speed to determine tire/wheel frequency and rpm. Calculate tire and wheel rpm and frequency by carrying out the following:

- Measure the diameter of the tire.
- Record the speed at which the vibration occurs.
- Obtain the corresponding tire and wheel rpm and frequency from the Tire Speed and Frequency Chart.
- If the vehicle speed is not listed, calculate the tire and wheel frequency as follows:
  - ◆ Divide the vehicle speed at which the vibration occurs by 16 km/h (10 mph). Multiply that number by the 16 km/h (10 mph) tire rpm listed for that tire diameter in the chart. Then divide that number by 60.
  - ◆ For example, if calculating the frequency based on vehicle speed in km/h for a 64 km/h vibration with 835 mm tires, divide 64 km/h by 16 km/h = 4. Multiply 4 by 105 rpm = 420. Divide 420 by 60 seconds = 7 Hz at 64 km/h.
  - ◆ If calculating the frequency based on vehicle speed in mph for a 40 mph vibration with 33 inch tires, divide 40 mph by 10 mph = 4. Multiply 4 by 105 rpm = 420. Divide 420 by 60 seconds = 7 Hz at 40 mph.
  - ◆ The calculated frequency of 7 Hz is the first order tire and wheel vibration; the second order tire and wheel vibration would be twice this number at 14 Hz; the third order tire and wheel vibration would be 21 Hz; and so on.

### Tire Speed and Frequency Chart

Tire Diameter	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz
mm (in)	@ 16 km/h (10 mph)	@ 80 km/h (50 mph)	@ 97 km/h (60 mph)	@ 113 km/h (70 mph)
483 (19)	182	910/15	1,092/18	1,274/21
508 (20)	173	865/14	1,038/17	1,211/20
533 (21)	165	825/14	990/16	1,155/19
560 (22)	158	790/13	948/16	1,106/18
585 (23)	151	755/13	906/15	1,057/18
610 (24)	145	725/12	870/14	1,015/17
635 (25)	139	695/12	834/14	973/16
660 (26)	134	670/11	804/13	938/16
685 (27)	129	645/11	774/13	903/15
710 (28)	124	620/10	744/12	868/14

735 (29)	119	595/10	714/12	833/14
760 (30)	115	575/10	690/11	805/13
785 (31)	111	555/9	666/11	777/13
810 (32)	108	540/9	648/11	756/13
835 (33)	105	525/9	630/10	735/12
864 (34)	102	510/8	612/10	714/12

### Calculating Driveshaft Frequency

Knowing the tire and wheel frequency allows for easy calculation of driveshaft frequency. The driveshaft drives the tires through the rear axle. Therefore, to determine driveshaft frequency, multiply tire and wheel frequency by the ratio of the rear axle. Calculate driveshaft frequency by carrying out the following steps:

- Obtain the axle ratio of the vehicle. Suppose the vehicle has a vibration problem at 64 km/h (40 mph) and a rear axle ratio of 3.08:1.
- Multiply the tire and wheel frequency of 7 Hz (calculated previously) with the rear axle ratio of 3.08:1. This results in a driveshaft frequency of 22 Hz at a vehicle speed of 64 km/h (40 mph).

The calculated frequency of 22 Hz is the first order driveshaft frequency; the second order frequency of the driveshaft is twice this number, or 44 Hz; and so on.

### Calculating Engine Frequency

Use the engine rpm where the vibration symptom occurs to determine engine frequency. Calculate engine frequency by dividing the engine rpm by 60 (the number of seconds in a minute). For example, if the corresponding engine rpm of a vibration concern on a vehicle is 2,400 rpm, the resulting engine frequency is 40 Hz. Therefore, a 40 Hz vibration is a first order engine vibration. For purposes of vibration diagnosis, the engine also includes the torque converter and exhaust system.

### Calculating Engine Accessory Frequency

Belt-driven engine accessories often produce vibrations at different frequencies than the engine itself. This is because the drive ratio created by the different size pulleys causes them to rotate at different speeds. Determining engine accessory frequency is comparable to calculating driveshaft frequency.

Calculate engine accessory frequency by carrying out the following steps:

- Determine the size ratio factor between the accessory pulley and the crankshaft pulley. For example, if the diameter of the crankshaft pulley is 6 inches and the accessory pulley diameter is 2 inches, the accessory pulley rotates 3 times for every crankshaft rotation (6 divided by 2).
- Multiply the engine rpm where the vibration condition occurs by the number of times the accessory pulley is rotating per crankshaft revolution. For example, if the engine rpm is 2,400 rpm, the accessory is rotating at 7,200 rpm (2,400 rpm multiplied by 3).
- Divide the accessory rpm by 60 (the number of seconds in a minute). In this example, the engine accessory frequency is 120 Hz (7,200 divided by 60).

### Calculating Engine Firing Frequency

Engine firing frequency is a term used to describe the pulses an engine creates from the firing of the cylinders. Engine firing frequency depends on how many cylinders an engine has. The number of times an engine fires a cylinder with each crankshaft revolution is equal to one-half the number of cylinders. A 4-cylinder engine fires 2 cylinders with each crankshaft revolution. Two revolutions of the crankshaft fire all 4 cylinders. A 6-cylinder engine fires 3 cylinders with each crankshaft revolution. An 8-cylinder engine fires 4 cylinders for each crankshaft revolution.

Calculate engine firing frequency by carrying out the following steps:

- Multiply the engine rpm where the vibration symptom occurs by the number of cylinders fired with each crankshaft revolution. For example, a vehicle with a 6-cylinder engine experiences a vibration concern at 2,400 rpm. The engine is firing the cylinders at 7,200 times per minute (3 multiplied by 2,400).
- Divide this number by 60 (the number of seconds in a minute) to obtain the engine firing frequency. In this example, the engine firing frequency is 120 Hz (7,200 divided by 60) at 2,400 rpm.

## Frequency and RPM Calculations Worksheet

FREQUENCY AND RPM CALCULATIONS	
<b>TIRE AND WHEEL</b>	
Vibration occurs at _____ mph (km/h)	
Tire diameter _____	
Tire speed RPM and frequency from chart _____ RPM _____ Hz	
<b>DRIVESHAFT</b>	
Tire/wheel frequency _____ x axle ratio = _____ Hz	
Tire/wheel RPM _____ x axle ratio = _____ RPM	
<b>ENGINE FREQUENCIES AND ASSOCIATED RPMS</b>	
Engine RPM divided by 60 equals 1st order frequency _____ Hz	
1st order RPM x 2 = 2nd order RPM (normal for 4 cylinder engines)	
Cylinders fired per engine revolutions _____ RPM	
1st order Hz x 2 = 2nd order Hz (normal for 4 cylinder engines) _____ Hz	
1st order RPM x 3 = 3rd order RPM (normal for 6 cylinder engines)	
1st order Hz x 3 = 3rd order Hz (normal for 6 cylinder engines)	
x 4 = 4th order vibrations (normal for 8 cylinder engines)	
x 5 = 5th order, x 6 = 6th order, etc.	
Order of vibration x engine RPM equals cylinders fired per minute _____ RPM	
Order of vibration (2nd, 3rd, 4th etc.) x 1st order Hz equals _____ Hz

## Harshness Symptoms

Harshness is customer perception, which gives the impression of no isolation from the tire/wheel and suspension system. Harshness may be caused by road conditions, temperature changes, component damage and/or incorrect customer modifications on original components/specifications. Customers usually experience harshness when the vehicle is driving over bumps or potholes and in cold weather conditions. Harshness can also be experienced with excessive tire pressure, sporty tires, heavy-duty springs and shocks or other vehicle modifications. Some aftermarket tires, even with the correct size, may change vehicle behavior and produce

customer concerns. The first step in diagnosing a harshness concern is to determine if the concern was experienced only in certain specific operating conditions, such as large potholes or extremely cold weather. In these cases, harshness should be considered normal. A known good vehicle can be driven under the same conditions and the rides can be compared to determine whether the concern is normal or vehicle specific. The second step is to check tire pressure and make sure it was set within vehicle specifications. The third step is to inspect for aftermarket or modified components and determine if they are the cause of the harshness complaint. If the harshness concern persists after the above steps, it is possible that some components are damaged. Based on the results from the road test, make a determination of which action in the Symptom Chart to take first.

### NVH Symptom Chart Categories

A good diagnostic process is a logical sequence of steps that lead to the identification of a causal system. Use the symptom and possible system categories as follows:

- Identify the operating condition that the vehicle is exhibiting
- Match the operating condition to the symptom
- Verify the symptom
- Calculate the frequency and order of the symptom
- Identify which category or system(s) could cause the symptom
- Refer to the section indicated to identify and diagnose the symptom or confirm that the system is not the source of the condition

Use the diagnostic instructions in this section along with the necessary listed tools to identify the vibration order and to isolate the symptom and the possible systems associated with that symptom. Then based on the results from the road test, make a determination of which action in the Symptom Chart to take first. Since it is possible any one of multiple systems may be the cause of the symptom, it may be necessary to use a process of elimination type diagnostic approach to pinpoint the concern. Refer to the section(s) indicated to identify and isolate the cause or rule that system out as being the causal system for the symptom.

### Symptom Chart - Vehicle-Speed Related Vibrations

**NOTE:** Any assembly that is out of balance will only cause a first order vibration, it will not cause a higher order vibration.

When a vehicle-speed related vibration is present, both tire-speed related vibration and driveshaft-speed related vibration calculations should be carried out.

#### Symptom Chart - Tire-Speed Related Vibrations

Symptom Chart - Tire-Speed Related Vibrations

#### Symptom Chart - Driveshaft-Speed Related Vibrations

Symptom Chart - Driveshaft-Speed Related Vibrations

**NOTE:** Any assembly that is out of balance will only cause a first order vibration, it will not cause a higher order vibration.

#### Condition Possible Sources Action

- First order driveshaft vibration

- Driveshaft
- REFER to Section 205-00 .
- Pinion gear
- REFER to Section 205-00 .
- Pinion bearing
- REFER to Section 205-00 .
- Second order driveshaft vibration
- U-joint
- REFER to Section 205-00 .
- Output shaft bushing in transmission
- Refer to the appropriate section in Group 307 for the procedure. GO to Symptom Chart in the appropriate section.
- Third order driveshaft vibration
- Axle shaft
- REFER to Section 205-00 .
- Ring gear
- REFER to Section 205-00 .

### Symptom Chart - Engine-Speed Related Vibrations

#### Symptom Chart - Engine-Speed Related Vibrations

**NOTE:** When an engine-speed related vibration is present, engine, engine accessory and engine firing calculations should be carried out.

**NOTE:** Any assembly that is out of balance will only cause a first order vibration, it will not cause a higher order vibration.

**NOTE:** Some engine-speed related vibrations are normal though they should not be felt in the passenger compartment.

#### ConditionPossible SourcesAction

- 0.5 order engine vibration
- Engine
- REFER to Section 303-00 .

- First through sixth order engine vibration
- Engine
- REFER to Section 303-00 .
- Transmission
- Refer to the appropriate section in Group 307 for the procedure. GO to Symptom Chart in the appropriate section.
- Engine mounts
- REFER to Section 303-00 .
- Transmission mounts
- Refer to the appropriate section in Group 307 for the procedure. GO to Symptom Chart in the appropriate section.
- Exhaust system
- REFER to Section 309-00 .
- Belt driven accessory speed vibration
- Engine pulley
- REFER to Section 303-00 .
- Coolant pump
- REFER to Section 303-00 .
- Generator
- REFER to Section 414-00 .
- A/C compressor
- REFER to Section 412-00 .
- Power steering pump
- REFER to Section 211-00 .
- Vacuum pump
- REFER to Section 303-00 .
- Accessory drive belt
- REFER to Section 303-00 .

**Symptom Chart - Noise, Air Leaks or Water Leaks**

Symptom Chart - Noise, Air Leaks or Water Leaks

**Symptom Chart - Harshness**

Symptom Chart - Harshness

---

## SECTION 501-00: Body System - General Information

2010 Crown Victoria, Grand Marquis  
Workshop Manual

## SPECIFICATIONS

Procedure revision date: 08/19/2009

---

## Material

Item	Specification	Fill Capacity
3MTM Strip Caulk - Black 051135-08578	WSB-M4G32-C	-
Seam Sealer TA-2	-	-
Clear Silicone Rubber TA-32	ESB-M4G92-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4	-
Silicone Spray Lubricant XL-6	ESR-M13P4-A	-
Trim and Weatherstrip Adhesive TA-14-A	-	-

---

**Insulation**

Insulation is used as a sound-deadener to reduce exterior road and powertrain noises from the interior of the vehicle. Mastic insulators are also used as insulation. For information on the location of the mastic insulators, refer to Section 501-35 . Insulation is installed:

- under the roof panel.
  - above and below the instrument panel.
  - on the cowl sides.
  - over the front and rear floor areas.
  - in the B-pillar and C-pillar sections.
-

## **Body Sealer Types And Applications**

### **Seam Sealer**

Seam Sealer TA-2 or equivalent:

- is a heavy-bodied, non-sag adhesive/sealer for use on standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans.
- can be used on water leaks and noise concerns.

### **Clear Silicone Rubber**

Clear Silicone Rubber TA-32 or equivalent meeting Ford Specification ESB-M4G92-A:

- does not run.
- is fast drying.
- remains semi-elastic.
- can be used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

### **Silicone Gasket and Sealant**

Silicone Gasket and Sealant TA-30 or equivalent meeting Ford specification WSE-M4G323-A4:

- is a form-in-place gasket and multi-purpose adhesive/sealant.
- is a room temperature curing silicone rubber.

### **Caulking Cord**

3MTM Strip Caulk-Black 051135-08578 or equivalent meeting Ford specification WSB-M4G32-C:

- is a heavy-bodied, plastic base with a filler.
- is commonly known as perma-gum.
- is used on spot-weld holes and between surfaces not sealed with a gasket.

### **Weatherstrip Adhesive**

Trim and Weatherstrip Adhesive TA-14-A or equivalent:

- is a quick drying, strong adhesive designed to hold weatherstripping onto all body panels and surrounding metal.

### **Silicone Lubricant**

Silicone Spray Lubricant XL-6 or equivalent meeting Ford specification ESR-M13P4-A:

- is used to keep the door and the window weatherstrip pliable and soft.
- makes the door easier to close.
- retards weatherstrip squeaks.
- retards weatherstrip wear.

- helps retain door window alignment by reducing friction between the glass frame and the rubber weatherstrip.
  - should not be used prior to painting.
-

**Body System**

## Material

Item	Specification
Seam Sealer TA-2	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

**Inspection and Verification****Dust and Water Leaks**

Most dust and water leaks occur due to missing or mis-installed body sealer or components. The source of the leak is detected by:

- pressurizing the vehicle and testing with soapy water.
  - ◆ Locate and tape off the body vents.
  - ◆ Turn the blower motor on the high position.
  - ◆ Turn the air recirculation to the off mode.
  - ◆ Close the windows and doors.
  - ◆ Open the hood and spray soapy water along body seams and grommets. Make sure to test the areas around the A-pillar at the fender and the hood hinge area.
  - ◆ Check for bubbles.
- inspecting for a dust pattern or water path near and above the area in question.
- removing any trim or carpet in the general area of the leak.
- road testing or water-hose testing the vehicle.
- placing a bright light under the vehicle, removing any necessary trim or carpet and inspecting the interior of the body at joints and weld lines.

**Wind Noise**

Most wind noise leaks occur at the corners of the windows or in the doors. Wind noise is detected by driving the vehicle at highway speeds or at speeds as specified by the customer. The vehicle should be driven in 4 different directions, with all the windows CLOSED, the radio OFF and the A/C blower motor OFF.

**Squeak and Rattle**

Squeak and rattle noises are generally caused by loose parts, contact or relative movement between 2 surfaces or loose wires and connectors. The source of the noise can be detected by stopping movement of the suspect part by hand or by using dampening or low friction materials.

**Symptom Chart - NVH**

Symptom Chart - NVH

**NOTE:** NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible that any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

**Condition Possible Sources Action**

- Draft/wind noise and water leak around door perimeter
- Loose fit seal
- PINCH seal carrier to improve retention on seal flange.
- Seal installed incorrectly
- REINSTALL the seal.
- Door misaligned
- REALIGN the door. CHECK door gaps and fit in door opening and ADJUST as necessary. REFER to Section 501-03 .
- Scuff plate installed incorrectly
- REINSTALL the scuff plate.
- Seal or seal pushpins damaged
- INSTALL a new seal/pushpins.
- Sheet metal joints in door or door opening
- SEAL leaks with silicone gasket and sealant.
- Draft/wind noise and water leak around glass run
- Door glass misaligned
- ADJUST door glass.
- Glass run installed incorrectly
- REINSTALL glass run. INSERT foam in glass run carrier if necessary.
- Leak path behind glass run
- INSTALL foam rope behind glass run.
- Glass run channel spread wide
- PINCH glass run channel to reduce size of opening.

- Glass run damaged
- INSTALL a new glass run.
- Draft/wind noise and water leak at inner belt line
- Belt line seal installed incorrectly on flange
- ADJUST seal. (Do not bend the flange.)
- No contact with side glass
- ADJUST door glass.
- No contact with glass runs at both ends of belt line seal
- ADJUST belt line seal or ADD foam at seal ends.
- Belt line seal damaged
- INSTALL a new seal.
- Draft/wind noise and water leak at outer belt line
- Belt line seal installed incorrectly on flange (no glass contact)
- ADJUST seal.
- Belt line seal does not contact the glass
- ADJUST door glass.
- No contact with glass runs at both ends of belt line seal
- ADJUST belt line seal or ADD foam at seal ends.
- Belt line seal damaged
- INSTALL a new seal.
- Draft/wind noise at inner door handle/speaker opening
- Hole in weathershield
- SEAL hole with suitable tape.
- Weathershield misaligned
- REALIGN weathershield. INSTALL a new weathershield if pressure sensitive adhesive fails.
- Exterior door handle seal misaligned/damaged
- REALIGN or INSTALL a new seal as necessary. REFER to Section 501-14 .

- Speaker or speaker seal missing or damaged
- REPAIR speaker seal or INSTALL a new door speaker.
- Draft/wind noise and water leaks at floor pan and grommets
- Missing or damaged plugs/grommets
- CHECK plugs/grommets for correct installation or damage. INSTALL new plugs/grommets if necessary.
- Road noise
- Missing mastic insulators
- CHECK for missing mastic insulators. REFER to Section 501-35 .
- Missing body insulators
- CHECK for missing body insulators.
- Rattles in body/doors and instrument panel
- Loose wires/cables
- CHECK that all wires/cables are correctly routed and inserted in correct retainers.
- Loose objects/components in door wells, pillars or quarter trim panels
- CHECK doors by carefully striking underside of doors with a rubber mallet while listening for rattles in doors and pillars. REMOVE or TIGHTEN loose objects/components.
- Buzz from instrument panel components
- IDENTIFY which components of the instrument panel are buzzing. SECURE/FASTEN components as necessary, ADD foam or felt as needed if rattle persists.
- Door drain holes collecting water
- Holes clogged with mud or road tar
- CLEAN drain holes of foreign material with a punch or screwdriver. CHECK drain holes regularly.
- Wind noise from exterior rear view mirror
- Exterior mirror housing misaligned
- REALIGN with edges shingled to airflow, with no gaps.
- Mirror sail gasket folded/misaligned
- REINSTALL with gasket unfolded and aligned correctly.
- Mirror housing trim cap installed incorrectly

- REINSTALL with edges shingled to airflow.
- Air leak through mirror housing hinge
- Fully ENGAGE mirror into its operating position. USE foam to block air path through hinge.
- Inner sail trim installed incorrectly
- REINSTALL sail trim. ADJUST door trim.
- Inner sail gasket/barrier installed incorrectly
- REINSTALL trim cover with gasket/barrier aligned correctly
- Air path through wiring bundle/fastener access holes
- BLOCK air path(s) with foam/tape.
- Exposed fastener access hole on mirror housing/sail
- INSTALL a new cap if missing.
- Rattle/vibration from exterior rear view mirror
- Mirror glass adjustment screws loose
- REMOVE mirror glass and TIGHTEN mirror glass adjustment motor screws. REFER to Section 501-09 .
- Mirror mounting nuts loose
- TIGHTEN mirror mounting nuts. REFER to Section 501-09 .
- Aftermarket air deflector/stone shields
- If possible, REMOVE aftermarket air deflector/stone shield, then ROAD TEST vehicle. If concern is no longer present, ADVISE customer that aftermarket component was causing concern.
- Draft/wind noise and water leak around perimeter of all fixed glass
- Gaps in the sealant bead
- APPLY approved sealant.
- Air traveling up windshield molding along A-pillar
- INSTALL foam rope full length of the A-pillar.
- Gaps in sealant bead of windshield/rear glass
- RESEAL windshield/rear glass. REFER to Section 501-11 .
- Windshield/rear glass misaligned or not installed correctly

- REINSTALL windshield/rear glass. REFER to Section 501-11 .
- Rear hood seal at base of windshield misaligned/damaged
- REALIGN or INSTALL a new seal as necessary.
- Air leak at cowl
- Cowl seal misaligned/damaged
- REALIGN or INSTALL a new seal as necessary.
- Wind noise created by airflow over or behind body panels
- Fender splash shield misaligned
- REALIGN fender splash shield.
- Body panel misaligned (exposed edge)
- REALIGN appropriate body panel.
- Hood misaligned (front margin)
- CHECK hood gaps and fit. ADJUST hood as necessary.
- Front grille edge noise
- APPLY foam in hollow areas behind louvers.
- Wind noise created by grille opening panel
- Grille relationship to leading edge on hood
- If possible, ADJUST grille opening panel forward to eliminate wind noise.
- Sharp edges due to material imperfections
- REMOVE sharp edges (no damage to visible surface).
- Wind noise from air extractor
- Air extractor housing seated incorrectly
- REINSTALL air extractor housing.
- Air extractor housing or flaps damaged
- INSTALL a new air extractor.
- Wind noise from bug shield/exterior windshield sun visor
- Turbulence created by location and shape

- DETERMINE if an OEM part or aftermarket. If aftermarket, ADVISE customer accordingly. If OEM, VERIFY correctly installed. If noise is abnormal, REPAIR or INSTALL new as required.
-

**Torque Specifications**

<b>Description</b>	<b>Nm</b>	<b>lb-ft</b>	<b>lb-in</b>

**Fender Splash Shield - LH**

Item	Part Number	Description
1	-	PCM bolt
2	-	PCM
3	9P686	Air cleaner housing insulator
4	N800576	Upper fender splash shield bolt (part of 16044/45)
5	-	Air compressor bracket nuts (part of 5319 ) (3 required)
6	-	Air compressor electrical connector (part of 14290)
7	-	Air pressure hose locator (part of 5A897)
8	-	Air intake pin-type retainer (part of 5319)
9	-	Air intake (part of 5319)
10	5319	Air compressor
11	-	ABS sensor electrical connector (part of 14290)
12	-	Splash shield pin-type retainer (part of 16044/45)
13	-	Inner splash shield bolts (part of 16044/45) (2 required)
14	16044/45	Fender splash shield

**Removal and Installation**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A.
2. **⚠ WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B. Failure to follow the instructions may result in serious personal injury.**

Disconnect the battery. For additional information, refer to Section 414-01.

3. Remove the air cleaner. For additional information, refer to Section 303-12.
4. Remove the bolt and position the PCM aside.
  - To install, tighten to 10 Nm (89 lb-in).
5. Release the wiring harness locator from the fender splash shield.
6. Release the front ABS sensor wiring harness locator.
7. Remove the air cleaner housing insulator.
8. Remove the upper fender splash shield bolt.
  - To install, tighten to 12 Nm (106 lb-in).
9. If equipped, remove the air compressor bracket nuts.
  - To install, tighten to 8 Nm (71 lb-in).
10. If equipped, disconnect the air compressor electrical connector.
11. If equipped, release the air pressure hose locator.
12. If equipped, disconnect the pin-type retainer and position the air compressor air intake aside.
13. Remove the 2 inner bolts, the pin-type retainer and the fender splash shield.
  - To install, tighten to 12 Nm (106 lb-in).
14. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B. Failure to follow these instructions may result in serious personal injury.**

To install, reverse the removal procedure.

---

**Fender Splash Shield - RH**

Item	Part Number	Description
1	-	Battery tray bolt (part of 10732)
2	N800576	Splash shield bolts (part of 16044/45) (2 required)
3	16044/45	Splash shield

**Removal and Installation**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#).
2. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#). Failure to follow the instructions may result in serious personal injury.

Remove the battery. For additional information, refer to [Section 414-01](#).

3. Remove the battery tray bolt.
  - To install, tighten to 12 Nm (106 lb-in).
4. Remove the 2 bolts and the fender splash shield.
  - To install, tighten to 12 Nm (106 lb-in).
5. **⚠ WARNING:** If equipped with fire suppression system, refer to [Section 100-02B](#) for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

To install, reverse the removal procedure.

SECTION 501-02: Front End Body Panels  
REMOVAL AND INSTALLATION2010 Crown Victoria, Grand Marquis Workshop Manual  
Procedure revision date: 08/19/2009**Fender**

Item	Part Number	Description
1	N606677	Hood hinge-to-hood bolts (4 required)
2	16612	Hood
3	W704873	Wiring trough screws (2 required)
4	-	Wiring trough (part of 14290)
5	-	Ground wire bolt (2 required)
6	N803946	Rocker panel pin-type retainer
7	N807316	Rocker panel fender bolts (2 required)
8	N807316	Rear fender bolt (2 required)
9	N807316	Rear fender brace bolt
10	N807316	Upper rear fender bolts (2 required)
11	N807316	Lower front fender bolts (2 required)
12	N807316	Fender-to-radiator support bolts (2 required)
13	N606678	Radiator grille opening panel bolt
14	N808623	Fender front bolt
15	N807316	Fender radiator grille opening panel front bolt
16	N602480	Fender rear inner bolt
17	16006 LH/ 16005 RH	Fender

## Removal

**NOTE:** LH fender shown, RH fender similar.

1. **NOTE:** The pin-type retainers are a one-time use item, and new pin-type retainers must be installed after removal.

If equipped with an engine compartment lamp, remove the pin-type retainers and position the hood insulation aside.

2. If equipped, release the wiring harness locators and disconnect the engine compartment lamp electrical connector.
3. **NOTE:** Two technicians are needed to carry out this step.

**NOTE:** Support the hood with a suitable hood support.

Remove the hood.

- Mark the hinge locations.
- Remove the 4 hood hinge-to-hood bolts.

4. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B**. Failure to follow the instructions may result in serious personal injury.

**⚠ WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

Remove the front bumper cover. For additional information, refer to **Section 501-19**.

5. Remove the fender splash shield. For additional information, refer to **Fender Splash Shield - LH** or **Fender Splash Shield - RH** in this section.
6. **NOTE:** Slide the wiring trough forward to release the trough locator from the fender.  
  
Remove the 2 screws and position the wiring trough and the hood release cable aside.
7. Remove the 2 ground wire bolts as required.
8. Remove the pin-type retainer and loosen the rocker panel moulding.
9. Remove the 2 rocker panel fender bolt.
10. Remove the rear fender bolt.

11. Remove the rear fender brace bolt.
12. Remove the 2 upper rear fender bolts.
13. Remove the 2 lower front fender bolts.
14. Remove the 2 fender-to-radiator support bolts.
15. Remove the radiator grille opening panel bolt.
16. Remove the fender front bolt.
17. Remove the fender radiator grille opening panel front bolt.
18. **NOTE:** On the RH fender, an assistant is needed to support the fender when removing this bolt.

Remove the fender inner rear bolt and the fender.

### Installation

1. Position the fender.
  2. Install the fender rear inner bolt.
    - Tighten to 28 Nm (21 lb-ft).
  3. Install the 2 upper rear fender bolts.
    - Tighten to 43 Nm (32 lb-ft).
  4. Install the rear fender bolts.
    - Tighten to 28 Nm (21 lb-ft).
  5. Install the rear fender brace bolt.
    - Tighten to 28 Nm (21 lb-ft).
  6. Install the 2 rocker panel fender bolts.
    - Tighten to 28 Nm (21 lb-ft).
  7. Position the rocker panel moulding and install the pin-type retainer.
  8. **NOTICE: The vehicle must be at the ride height when the front of the fender is attached. Failure to lower the vehicle will cause a misalignment between the radiator support and the fender.**
- Install the 2 fender-to-radiator support bolts.
- Tighten to 12 Nm (106 lb-in).
9. Install the 2 lower front fender bolts.
    - Tighten to 12 Nm (106 lb-in).
  10. Install the front fender bolt.
    - Tighten to 12 Nm (106 lb-in).
  11. Install the radiator grille opening panel front bolt.

- Tighten to 12 Nm (106 lb-in).
12. Install the radiator grille opening panel bolt.
    - Tighten to 12 Nm (106 lb-in).
  13. **NOTE:** The wire harness trough is only located on the LH fender.

Position the wiring harness trough and hood latch release cable and install the 2 screws.
  14. Install the 2 ground wire bolts.
    - Tighten to 5 Nm (44 lb-in).
  15. Install the fender splash shield. For additional information, refer to Fender Splash Shield - LH or Fender Splash Shield - RH in this section.
  16. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

Install the front bumper cover. For additional information, refer to Section 501-19 .
  17. **NOTE:** Two technicians are needed to carry out this step.

Line up the hood with the marks on the hinges and install the 4 hood hinge-to-hood bolts.

    - Tighten to 12 Nm (106 lb-in).
    - Align the hood as necessary.
  18. If equipped, install the wiring harness locators and connect the engine compartment lamp electrical connector.
  19. If equipped with an engine compartment lamp, position the hood insulation and install the pin-type retainers.
-

**Radiator Grille Opening Panel**

Item	Part Number	Description
1	N606677	Radiator grille opening panel bolts (4 required)
2	8190	Radiator grille opening panel

**Removal and Installation**

1. Remove the LH and RH front fenders. For additional information, refer to Fender in this section.
2. Remove the 4 bolts and the radiator grille opening panel.
  - To install, tighten to 12 Nm (106 lb-in).
3. To install, reverse the removal procedure.

**Cowl Panel Grille**

Item	Part Number	Description
1	-	Cowl panel grille weather seal (part of 02228)
2	N610021	Cowl panel grille screws (part of 02228) (6 required)
3	391349	Cowl panel grille pin-type retainers (part of 02228) (2 required)
4	N805886	Cowl panel grille retainer clips (5 required)
5	02222	Cowl panel grille
6	-	Washer hose union (part of 17K605)

**Removal and Installation**

1. Remove the wiper pivot arms. For additional information, refer to [Section 501-16](#).
2. Remove the 6 cowl panel grille screws.
3. Remove the 2 cowl panel grille pin-type retainers.
4. Remove the 4 cowl panel grille retainer clips.
5. Position the cowl panel grille aside and disconnect the washer hose union.
6. Remove the cowl panel grille.
7. To install, reverse the removal procedure.
  - If installing a new cowl panel grille, transfer components as necessary.

**Torque Specifications**

<b>Description</b>	<b>Nm</b>	<b>lb-ft</b>	<b>lb-in</b>
Door latch striker bolt	40	30	-
Front door hinge-to-body bolts/nuts	30	22	-
Front door hinge-to-door bolts	30	22	-
Lower door hinge nut	30	22	-
Luggage compartment lid bolts	6	-	53
Rear door hinge-to-body nuts	30	22	-
Rear door hinge-to-door bolts	30	22	-

---

---

**Door Alignment - Front****All alignments**

1. Loosen the door latch striker.

**In and out, up and down alignment**

2. Loosen the door hinge-to-door bolts.

3. Align the door to specifications. For additional information on door clearances, refer to [Section 501-35](#).
4. Tighten the door hinge-to-door bolts to 30 Nm (22 lb-ft).

**Fore and aft alignment**

5. Remove the cowl side trim panel.
6. Loosen the lower door hinge-to-body nut.
7. Remove the front fender. For additional information, refer to [Section 501-02](#).
8. Loosen the 3 door hinge-to-body bolts and upper hinge-to-body nut.

9. Align the door to specifications. For additional information on door clearances, refer to [Section 501-35](#) .
10. Tighten the 3 door hinge-to-body bolts and the 2 hinge-to-body nuts to 30 Nm (22 lb-ft).
11. Install the front fender. For additional information, refer to [Section 501-02](#) .

#### **All alignments**

12. Adjust the door latch striker. For additional information, refer to [Striker Adjustment](#) in this section.
-

---

**Door Alignment - Rear****All alignments**

1. Loosen the door latch striker.

**In and out, up and down alignment**

2. Loosen the 4 door hinge-to-door bolts.

3. Align the door to specifications. For additional information on door clearances, refer to [Section 501-35](#).
4. Tighten the 4 door hinge-to-door bolts to 30 Nm (22 lb-ft).

**Fore and aft alignment**

5. Remove the front and rear door scuff plates and position aside the lower B-pillar trim panel.
6. Loosen the 4 door hinge-to-body nuts.

7. Align the door to specifications. For additional information on door clearances, refer to [Section 501-35](#).
8. Tighten the 4 door hinge-to-body nuts to 30 Nm (22 lb-ft).

**All alignments**

9. Adjust the door latch striker. For additional information, refer to [Striker Adjustment](#) in this section.
-

### **Luggage Compartment Lid Alignment**

1. Loosen the 4 luggage compartment lid bolts.
  2. Align the luggage compartment lid to specifications. For additional information on luggage compartment lid clearances, refer to Section 501-35 .
  3. Tighten the 4 luggage compartment lid hinge bolts to 6 Nm (53 lb-in).
-

## Striker Adjustment

1. Loosen the door latch striker.

2. Align the door latch striker to specifications. For additional information on door clearances, refer to [Section 501-35](#).

3. Tighten the door latch striker to 40 Nm (30 lb-ft).
-

---

**Torsion Bar Loading**

**⚠ WARNING:** Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

1. **NOTE:** The luggage compartment lid tension should be decreased if the luggage compartment lid opens with more force than desired. The luggage compartment lid tension should be increased if the luggage compartment lid opens with less force than desired.

Open and support the luggage compartment lid in the full-open position.

2. **⚠ WARNING:** Securely grasp the luggage compartment lid torsion bar while adjusting. The bar is under tension and could spring out unintentionally if it is not handled correctly. Failure to follow this instruction may result in serious personal injury.

Move the luggage compartment lid end of the luggage compartment lid torsion bar to another position.

3. Check the adjustment.
4. **⚠ WARNING:** Securely grasp the luggage compartment lid torsion bar while adjusting. The bar is under tension and could spring out unintentionally if it is not handled correctly. Failure to follow this instruction may result in serious personal injury.

Move the luggage compartment door end of the luggage compartment lid torsion bar to another position.

**Door - Front****NOTE:** Front door shown.

Item	Part Number	Description
1	5422800	Upper door hinge
2	N621941-S2	Door hinge-to-body nut (1 required per hinge)
3	N806738-S2	Door hinge-to-body bolt (2 required for upper hinge, 1 required for lower hinge)
4	N806738-S2	Door hinge-to-door bolt (2 required per hinge)
5	5422806	Lower door hinge
6	-	Door assembly

**Removal and Installation**

1. Disconnect the electrical connector at the door.

2. **NOTICE:** To avoid damaging the door, this step requires an assistant.

With a wax pencil, mark the position of each hinge and remove the door hinge-to-door bolts.

- To install, tighten to 30 Nm (22 lb-ft).

3. Remove the door.

4. **NOTICE:** To minimize the possibility of cross threading, hand start all fasteners during the installation.

To install, reverse the removal procedure.

- Check for correct door alignment. For additional information, refer to Door Alignment - Front in this section.

**Door - Rear**

Item	Part Number	Description
1	N806738-S2	Rear door hinge-to-door bolts
2	N621941-S2	Rear door hinge-to-body nuts
3	5426800	Rear door upper hinge
4	5426806	Rear door lower hinge

**Removal and Installation**

1. Disconnect the electrical connector at the door.
2. **NOTICE:** To avoid damaging the door, this step requires an assistant.

With a wax pencil, mark the position of each hinge and remove the door hinge-to-door bolts.

- To install, tighten to 30 Nm (22 lb-ft).

3. Remove the door.

4. **NOTICE:** To minimize the possibility of cross threading, hand start all fasteners during installation.

To install, reverse the removal procedure.

- Check for correct door alignment. For additional information, refer to Door Alignment - Rear in this section.

**Luggage Compartment Lid**

Item	Part Number	Description
1	-	Luggage compartment lid bolts (4 required)
2	5440170	Luggage compartment lid

**Removal**

1. If equipped, remove the luggage compartment lid trim panel.
2. Disconnect the 3 electrical connectors.
3. Release the luggage compartment lid wiring harness retainers and remove the wiring harness.
4. Remove the 4 bolts and the luggage compartment lid.
  - To install, tighten to 6 Nm (53 lb-in).
5. To install, reverse the removal procedure.

SECTION 501-05: Interior Trim and  
Ornamentation  
REMOVAL AND INSTALLATION

2010 Crown Victoria, Grand Marquis Workshop  
Manual  
Procedure revision date: 08/19/2009

### Interior Trim - Exploded View

Item	Part Number	Description
1	03598	Upper A-pillar trim panel
2	16B999	Hood release bezel
3	02344	Lower A-pillar trim panel
4	13208	Front door scuff plate
5	13228	Rear door scuff plate
6	24346	Lower B-pillar trim panel
7	60262	Safety belt D-ring cover
8	N807537	D-ring bolt
9	N804992	Upper B-pillar trim panel screw
10	24346	Upper B-pillar trim panel
11	611B08	Safety belt
12	31012	Lower quarter trim panel
13	52018	Rear quarter trim panel
14	N610127	High mounted stoplamp screw (2 required)
15	13A613	High mounted stoplamp
16	14A005	High mounted stoplamp electrical connector
17	390018	Pin-type retainer (2 required)
18	46668	Parcel shelf

1. For additional information, refer to the procedures in this section.

## **B-Pillar Trim Panel**

### **Removal and Installation**

1. Remove the front and rear door scuff plates.
  2. Position the front and rear door weatherstrips aside.
  3. Remove the lower B-pillar trim panel.
  4. Remove the safety belt D-ring cover.
  5. Remove the safety belt D-ring bolt.
    - To install, tighten to 40 Nm (30 lb-ft).
  6. Remove the screw and the upper B-pillar trim panel.
  7. To install, reverse the removal procedure.
    - Check the restraint system for correct operation.
-

## **Quarter Trim Panel**

### **Removal and Installation**

1. Remove the rear seat. For additional information, refer to Section 501-10 .
  2. Position the rear door weatherstrip aside.
  3. Remove the upper rear quarter trim panel.
    - Slide the safety belt through the rear quarter trim panel opening.
  4. Remove the lower rear quarter trim panel.
  5. To install, reverse the removal procedure.
    - Check the restraint system for correct operation.
-

## **Parcel Shelf**

### **Removal and Installation**

#### **Vehicles with Police option**

1. If equipped, remove the flashing rear deck lights. For additional information, refer to Section 417-01 .

#### **All vehicles**

2. Remove the rear quarter trim panels. For additional information, refer to Quarter Trim Panel in this section.

#### **Vehicles without Police option**

3. Remove the 2 high-mounted stoplamp screws.
4. Disconnect and remove the high-mounted stoplamp.
5. Release and remove the high-mounted stoplamp brackets.

#### **All vehicles**

6. Remove the 2 pin-type retainers and the parcel shelf.
  7. To install, reverse the removal procedure.
    - Check the restraint system for correct operation.
-

**Door Trim Panel - Front**

Item	Part Number	Description
1	14528	Window control switch plate
2	-	Mirror control switch electrical connector (part of 14A005)
3	-	Door lock switch electrical connector (part of 14A005)
4	-	Master window control switch electrical connector (part of 14A005)
5	-	Master window lock-out switch electrical connector (part of 14A005)
6	23862	Door handle cup screw cover
7	W705133	Door handle cup screw
8	22634	Door handle cup
9	W705133	Front door trim panel screw (4 required)
10	-	Heated seat switch (if equipped) (part of 14C719)
11	-	Luggage compartment lid release switch electrical connector (part of 14A005)
12	-	Door entry lamp electrical connector (part of 14A005)
13	23942	Front door trim panel

**Removal and Installation**

**NOTE:** Driver door shown, passenger door similar.

1. Remove the exterior mirror cover.

**2. *NOTICE:* Use care not to damage the trim panel when removing the interior door handle.**

Remove the door handle cup screw cover, screw and door handle and cup.

**3. *NOTICE:* Use a shop towel or similar material between the tool and the front door trim panel or damage to the front door trim panel may occur.**

Remove the window control switch plate.

1. Locate the tooling notch in the window control switch plate.
2. Insert a towel covered flat-bladed screw driver in the notch.
3. Slightly twist the screw driver to release the plate from the door trim panel.
4. Disconnect the window regulator and door lock switch electrical connectors and remove the window control switch plate assembly.

4. Remove the 4 front door trim panel screws and position the front door trim panel aside.

5. Disconnect the 3 electrical connectors and remove the front door trim panel.

6. To install, reverse the removal procedure.

---

**Door Trim Panel - Rear**

Item	Part Number	Description
1	23862	Door handle cup screw cover
2	N804592	Door handle cup screw
3	14A570	Window regulator switch plate
4	-	Window regulator switch electrical connector (part of 14A005)
5	N804592	Rear door trim panel screw (if equipped) (2 required)
6	27406	Rear door trim panel

**Removal and Installation**

**NOTE:** Driver side door shown, passenger side door similar.

1. Remove the door handle cup screw cover and the screw.
2. If equipped, remove the 2 passenger assist handle covers, 2 screws and the passenger assist handle.
3. **NOTICE:** Use a shop towel or similar material between the tool and the rear door trim panel or damage to the rear door trim panel may occur.

Release the window regulator switch plate, disconnect the electrical connector and remove the window regulator switch plate.

4. **NOTE:** Long Wheel Base (LWB) vehicles are equipped with 5 screws.

Remove the 2 screws and the rear door trim panel.

5. To install, reverse the removal procedure.

**Headliner**

Item	Part Number	Description
1	-	Sun visor screws (part of 04105) (8 required)
2	04105 / 04104	Sun visors (2 required)
3	-	Sun visor electrical connector (part of 14334) (2 required)
4	54041	Sun visor clip (2 required)
5	-	Passenger assist handle screw (part of 31406) (6 required)
6	31406	Passenger assist handle (3 required)
7	N802734	Headliner pin-type retainers (2 required)
8	-	Headliner electrical connector (part of 14A464)
9	51916	Headliner

**Removal****All vehicles**

**⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B** . Failure to follow the instructions may result in serious personal injury.

1. Remove the front seats. For additional information, refer to **Section 501-10** .
2. If equipped, remove the floor console. For additional information, refer to **Section 501-12** .

3. **NOTICE:** The overhead console bracket is supported by the headliner. Failure to follow the removal procedure will damage the headliner.

**NOTE:** Support the headliner at the rear corner of the overhead console.

If equipped, remove the overhead console. Pull down on the rear corner of the overhead console and disconnect the electrical connectors.

4. If equipped, position the fire suppression manual switch aside.
5. Remove the LH and RH front door weatherstrips.
6. Remove the LH and RH upper A-pillar trim panels.
7. Remove the 8 screws, 2 sun visors and the 2 sun visor clips.
  - Disconnect the 2 electrical connectors.
8. Remove the B-pillar trim panel. For additional information, refer to B-Pillar Trim Panel in this section.
9. Remove the 6 screws and the 3 passenger assist handles.
10. Remove the rear quarter trim panel. For additional information, refer to Quarter Trim Panel in this section.
11. Remove the 2 pin-type retainers.

#### **Vehicles with roof opening panel**

12. **NOTICE:** Carefully pull the rear of the headliner down to gain access to the rear domelamp electrical connector.

Disconnect the rear domelamp electrical connector.

13. Remove the headliner retainer and pull down the sides of the headliner above the door openings.

#### **Vehicles without roof opening panel**

14. If equipped, disconnect the fire suppression manual switch electrical connector at the RH A-pillar.
15. Disconnect the headliner harness electrical connector at the RH C-pillar.
16. **NOTE:** Pull down the sides of headliner above the door openings to expose adhesive beads.

Using a hot knife or wide-blade putty knife, cut adhesive beads lengthwise across the headliner.

#### **All vehicles**

17. **NOTE:** A new headliner must be installed if the headliner is folded in half for removal.

Remove the headliner through the front door opening.

#### **Vehicles without roof opening panel**

18. Clean any remaining adhesive from the roof sheet metal.

### Installation

1.  **WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

**NOTE:** A new headliner needs to be installed if it is folded during removal or installation.

To install, reverse the removal procedure.

- Vehicles with roof opening panel, do not apply adhesive to the headliner.
  - Vehicles without roof opening panels, acquire commercially available headliner adhesive and apply using the existing pattern.
-

## SECTION 501-08: Exterior Trim and Ornamentation

2010 Crown Victoria, Grand Marquis  
Workshop Manual

## SPECIFICATIONS

Procedure revision date: 03/03/2010

---

## Material

Item	Specification	Fill Capacity
Motorcraft® Detail Wash ZC-3-A	-	-

---

**Body Side Moulding**

## Special Tool(s)

	Heat Gun 107-R0300
---	-----------------------

## Material

Item	Specification
Motorcraft® Detail Wash ZC-3-A	-

**NOTICE:** Body side molding installation should not be attempted on vehicle with surface temperatures below 21° C (70° F) or adhesion problems could occur.

1. **NOTICE:** The vehicle body must be clean prior to installation of an adhesive backed body side molding.

Wash and dry the vehicle exterior.

2. **NOTE:** The use of a small amount of heat may aid in removal of adhesive backed moldings do not exceed 52° C (125° F).

If installed, carefully remove the adhesive-back body side molding.

3. **NOTICE:** Do not use sharp objects or metal-bladed putty knives for removal as damage to paint could occur.

Remove all remaining adhesive from the vehicle body.

4. Clean the area with a commercially available wax and grease remover.
  - Re-clean the area using a commercially available alcohol cleaner

5. **NOTICE:** Do not exceed 52° C (125° F) or damage to the molding could occur.

If the molding is curled or distorted it may be brought back to correct shape when warmed.

6. Warm the moldings evenly on a flat surface prior to installation using a heat gun.
  - Temperature range should not exceed 38° C (100° F) - 52° C (125° F)

7. Remove the adhesive tape liner from the body side molding.

8. Properly position the molding to the vehicle and apply firm pressure to the entire molding until fully adhered to the vehicle body.

## Quarter Panel Moulding

### Removal and Installation

**NOTE:** Before removing the exterior mouldings, determine the type of retainer used and whether the respective door trim panel, quarter trim panel or luggage compartment trim panel must first be removed to provide access.

1. Remove the rear quarter trim panel. For additional information, refer to [Section 501-05](#) .
2. Remove the roof side moulding.

3. To install, reverse the removal procedure.
-

**License Plate Housing**

Item	Part Number	Description
1	W712159-S900	License plate housing nuts (8 required)
2	-	License plate lamp electrical connector (part of 13B433)
3	13B508	License plate housing (Grand Marquis)
3	13B433	License plate housing (Crown Victoria)

**Removal and Installation****All vehicles**

1. Remove the 8 license plate housing nuts.
2. Disconnect the license plate housing electrical connector.
3. Remove the 2 screws and the license plate.

**Grand Marquis**

4. Remove the 2 screws and the license plate housing.

**Crown Victoria**

5. Remove the 4 screws and the license plate housing.

**All vehicles**

6. To install, reverse the removal procedure.
-

**Torque Specifications**

<b>Description</b>	<b>Nm</b>	<b>lb-in</b>
Exterior mirror motor screws	2	18
Exterior mirror nuts	7	62

---

---

## Rear View Mirrors

The main components of the exterior rear view mirrors are:

- Exterior mirror control switch
- Exterior mirror cover
- Exterior mirror glass
- Exterior mirror glass adjustment motors
- Exterior mirror plastic housing

## Exterior Mirrors

### Power Exterior Mirrors

Power mirrors allow the driver or passenger mirror glass to be positioned electronically. The position of the power mirror glass is controlled by the exterior rear view mirror control switch. Adjusting the exterior rear view mirror control switch to the LH or RH position determines which power mirror glass will be controlled.

### Heated Exterior Mirrors

The power exterior rear view mirrors are available with a heated mirror glass feature, which heats the mirror glass to remove frost, snow, ice and condensation. The rear window defrost switch controls the operation of the heated exterior rear view mirrors. The heated exterior rear view mirrors only operate when the rear window defrost system is on.

## Interior Mirror

The vehicle may be equipped with one of the following interior rear view mirrors:

- Interior rear view mirror
- Interior auto-dimming rear view mirror
  - ◆ with compass

### Interior Rear View Mirror

The interior rear view mirror consists of a mirror glass and housing. The interior rear view mirror mounts to an interior rear view mirror bracket at the upper center of the windshield glass. The interior rear view mirror can be adjusted left, right, up and down using the 2 pivot points on the support arm. The interior rear view mirror can be adjusted from a day position to a night position to reduce unwanted glare caused by headlamps reflecting in the mirror. Adjusting the interior rear view mirror day/night tab, located at the bottom of the interior rear view mirror, rearward will adjust the interior mirror to the night position. Adjusting the interior rear view mirror day/night tab forward will adjust the interior mirror the day position.

### Interior Auto-Dimming Rear View Mirror

The interior auto-dimming rear view mirror feature automatically reduces the glare caused by headlamps reflecting in the interior rear view mirror. The interior auto-dimming rear view mirror adjusts the reflectance level of the interior rear view mirror glass to eliminate unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior mirror. When the forward sensor detects daytime conditions, the rearward sensor is inactive and the

interior rear view mirror stays in a high reflectance mode. When the forward sensor detects nighttime conditions, the rearward sensor is active and detects glare from the headlights of vehicles approaching from the rear or other glare-producing light sources. To provide increased visibility when backing up, the interior rear view mirror will automatically return to a high reflectance mode whenever the vehicle is in REVERSE.

---

**Rear View Mirrors - Exterior**

## Special Tool(s)

	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
---	---

**Principles of Operation**

The movement of the LH and RH exterior mirror glass is controlled by the exterior mirror control switch and the LH and RH exterior mirror motors. Adjusting the exterior mirror switch to the LH or RH position determines which exterior mirror motor will be controlled. The exterior mirror control switch logic is the selected movement request from the exterior mirror control switch. When the exterior mirror control switch is adjusted to the left, right, up or down position, the exterior mirror control switch will supply voltage and ground to the selected exterior mirror motor to move the exterior mirror glass to the desired position.

The exterior mirrors use a jumper harness between the vehicle wire harness connector and the exterior mirror motor. The exterior mirror jumper harness is integral to the exterior mirror. Before replacing an exterior mirror or mirror motor, inspect the jumper harness for open and shorted circuits or damaged and pushed-out pins. If a concern with the exterior mirror jumper harness exists, attempt to repair the jumper harness.

**Heated Exterior Mirror**

The rear window defrost switch controls the operation of the heated exterior rear view mirrors. The heated exterior rear view mirrors only operate when the rear window defrost system is operating. The heated exterior rear view mirror power is supplied by the rear defrost relay through Battery Junction Box (BJB) fuse 24 (10A), which isolates the heated exterior mirrors from the rear window defrost system in the event of a concern.

**Inspection and Verification**

**⚠ WARNING:** If equipped with fire suppression system, refer to **Section 100-02B** for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

**Visual Inspection Chart**

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Exterior mirror</li> <li>• Exterior mirror control switch</li> <li>• Exterior mirror glass</li> </ul>	<ul style="list-style-type: none"> <li>• Battery Junction Box (BJB) fuse 24 (10A)</li> <li>• Central Junction Box (CJB) fuse(s):               <ul style="list-style-type: none"> <li>◆ 2 (7.5A)</li> </ul> </li> </ul>

	<p>◆ 9 (7.5)</p> <ul style="list-style-type: none"> <li>• Exterior mirror control switch</li> <li>• Exterior mirror motor</li> <li>• Exterior mirror</li> <li>• Heated exterior mirror glass</li> <li>• Loose or corroded connections</li> <li>• Wiring harness</li> </ul>
--	--

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and GO to Symptom Chart - Exterior Mirrors or GO to Symptom Chart - NVH.

### Symptom Chart - Exterior Mirrors

Symptom Chart - Exterior Mirrors

### Symptom Chart - NVH

Symptom Chart - NVH

**NOTE:** NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

#### ConditionPossible SourcesAction

- Exterior mirror vibrates/loose
- Exterior mirror mounting nuts loose
- TIGHTEN the exterior mirror fasteners to the specified value located in the Specifications table.
- Exterior mirror glass loose
- PRESS the center of the exterior mirror glass up, down, left and right to make sure that the exterior mirror glass is seated correctly. If the exterior mirror glass is still loose, REMOVE the exterior mirror glass and INSPECT the exterior mirror backing plate for damage. If the exterior mirror backing plate is damaged, INSTALL a new exterior mirror glass. REFER to Exterior Mirror Glass in this section.
- Aftermarket air deflector/stone shields
- If possible, REMOVE aftermarket air deflector/stone shield, then ROAD TEST the vehicle. If concern is no longer present, ADVISE customer that aftermarket components were causing undesired vibration.

- Wind noise
- Foam gasket between the exterior mirror and door frame is missing or damaged
- VERIFY that the foam gasket is present and in good condition. If necessary, REPOSITION the foam gasket between the exterior mirror and door frame.
- Exterior mirror is not correctly fitted to the door
- VERIFY that there are no gaps between the exterior mirror and the door. If necessary, LOOSEN the exterior mirror nuts and REPOSITION the exterior mirror.
- Exterior mirror cover
- VERIFY that the exterior mirror cover is not loose or broken. If necessary, INSTALL a new exterior mirror cover. REFER to Exterior Mirror Cover in this section.

## Pinpoint Tests

### Pinpoint Test A: The Mirrors are Inoperative

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

#### Normal Operation

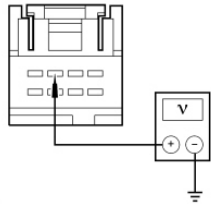

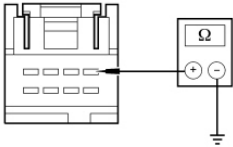

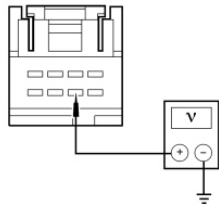

Under normal operation, the exterior mirror control switch receives voltage from Central Junction Box (CJB) fuse 2 (7.5A) through circuit 1523 (DG) and ground through circuit 57 (BK). The exterior mirror control switch uses circuit 945 (YE/BK) as the common circuit for both exterior mirror motor up/down and right/left movement.

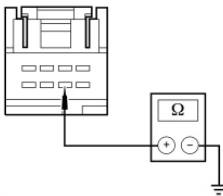

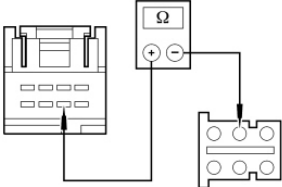

#### This pinpoint test is intended to diagnose the following:

- Fuse
- Exterior mirror control switch
- Wiring, terminals or connectors

#### PINPOINT TEST A: THE MIRRORS ARE INOPERATIVE

Test Step	Result / Action to Take
<b>A1 CHECK THE VOLTAGE TO THE EXTERIOR MIRROR CONTROL SWITCH</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Exterior Mirror Control Switch C527.</li> <li>• Measure the voltage between exterior mirror control switch C527-3, circuit 1523 (DG), harness side and ground.</li> </ul>	<p><b>Yes</b> GO to <u>A2</u> .</p> <p><b>No</b> VERIFY the CJB fuse 2 (7.5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. TEST the system for normal operation.</p>

 <p>N0006111</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	
<b>A2 CHECK CIRCUIT 57 (BK) FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Measure the resistance between exterior mirror control switch C527-1, circuit 57 (BK), harness side and ground.</li> </ul>  <p>N0006112</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p><b>Yes</b> GO to <u>A3</u> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>
<b>A3 CHECK CIRCUIT 945 (YE/BK) FOR A SHORT TO VOLTAGE</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Measure the voltage between exterior mirror control switch C527-6, circuit 945 (YE/BK), harness side and ground.</li> </ul>  <p>A0073142</p> <ul style="list-style-type: none"> <li>• Is any voltage present?</li> </ul>	<p><b>Yes</b> REPAIR the circuit. TEST the system for normal operation.</p> <p><b>No</b> GO to <u>A4</u> .</p>
<b>A4 CHECK CIRCUIT 945 (YE/BK) FOR A SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Measure the resistance between exterior mirror control switch C527-6, circuit 945 (YE/BK), harness side and ground.</li> </ul>	<p><b>Yes</b> GO to <u>A5</u> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

 <p>A0073143</p> <ul style="list-style-type: none"> <li>• Is the resistance greater than 10,000 ohms?</li> </ul>	
<b>A5 CHECK CIRCUIT 945 (YE/BK) FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Disconnect: LH Exterior Mirror C516.</li> <li>• Measure the resistance between exterior mirror control switch C527-6, circuit 945 (YE/BK), harness side and LH exterior mirror C516-2, circuit 945 (YE/BK), harness side.</li> </ul>  <p>N0089080</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms&gt;</li> </ul>	<p><b>Yes</b> INSTALL a new exterior mirror control switch. REFER to <u>Exterior Mirror Control Switch</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

### Pinpoint Test B: A Single Mirror is Inoperative

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

#### Normal Operation

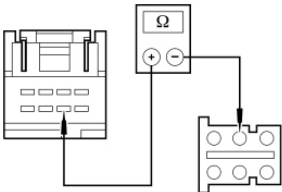

Under normal operation, the exterior mirror control switch uses circuit 945 (YE/BK) as the common circuit for both exterior mirror down/up and left/right movement.

**This pinpoint test is intended to diagnose the following:**

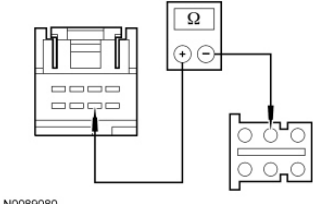

- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

#### PINPOINT TEST B: A SINGLE MIRROR IS INOPERATIVE

Test Step	Result / Action to Take
<b>B1 CHECK THE LH MIRROR OPERATION</b>	
<ul style="list-style-type: none"> <li>• Operate the LH exterior mirror using the exterior mirror control</li> </ul>	<p><b>Yes</b> GO to <u>B2</u> .</p>

TEST the system for normal operation.</p>
---	--

### Pinpoint Test C: A Single Mirror Does Not Function with Switch Logic

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

#### Normal Operation

Under normal operation, the exterior mirror control switch uses circuits 940 (DB/OG), 942 (RD/OG), 943 (VT/OG), 944 (DG/OG) and 945 (YE/BK) to control the exterior mirror motor movement. The exterior mirror switch controls the LH exterior mirror motor movement by switching voltage and ground to circuits 940 (DB/OG), 942 (RD/OG) and 945 (YE/BK). The exterior mirror switch controls the RH exterior mirror motor movement by switching voltage and ground to circuits 943 (VT/OG), 944 (DG/OG) and 945 (YE/BK).

#### Mirror Movement

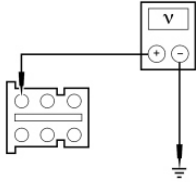

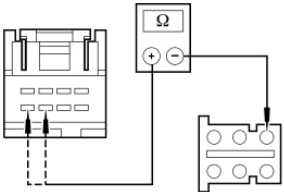

- When the LH/RH exterior mirror motor receives ground through circuit 940 (DB/OG)/943 (VT/OG) and voltage through circuit 945 (YE/BK), the LH/RH exterior mirror motor will operate downward.
- When the LH/RH exterior mirror motor receives voltage through circuit 940 (DB/OG)/943 (VT/OG) and ground through circuit 945 (YE/BK), the LH/RH exterior mirror motor will operate upward.
- When the LH/RH exterior mirror motor receives ground through circuit 942 (RD/OG)/944 (DG/OG) and voltage through circuit 945 (YE/BK), the LH/RH exterior mirror motor will operate rightward.
- When the LH/RH exterior mirror motor receives voltage through circuit 942 (RD/OG)/944 (DG/OG) and ground through circuit 945 (YE/BK), the LH/RH exterior mirror motor will operate leftward.

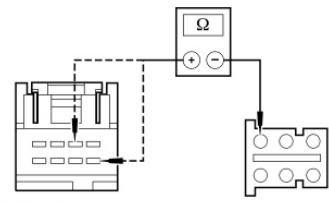

#### This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

## PINPOINT TEST C: A SINGLE MIRROR DOES NOT FUNCTION WITH SWITCH LOGIC

Test Step	Result / Action to Take
<b>C1 CHECK THE MIRROR MOVEMENT (LEFT/RIGHT)</b>	
<ul style="list-style-type: none"> <li>Operate the RH and LH exterior mirrors in the right and left direction using the exterior mirror control switch.</li> <li><b>Do the exterior mirrors move left and right?</b></li> </ul>	<p><b>Yes</b> GO to <u>C2</u> .</p> <p><b>No</b> GO to <u>C3</u> .</p>
<b>C2 CHECK THE MIRROR MOVEMENT (UP/DOWN)</b>	
<ul style="list-style-type: none"> <li>Operate the LH and RH exterior mirrors in the up and down direction.</li> <li><b>Do the exterior mirrors move up and down?</b></li> </ul>	<p><b>Yes</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.</p> <p><b>No</b> GO to <u>C4</u> .</p>
<b>C3 CHECK THE VOLTAGE TO THE INOPERATIVE MIRROR</b>	
<ul style="list-style-type: none"> <li>Ignition OFF.</li> <li>Disconnect: Inoperative Exterior Mirror C516 (LH) or C622 (RH).</li> <li><b>NOTE:</b> Position the exterior mirror control switch to the LH or RH mirror position.</li> <li>While operating the exterior mirror control switch in the LEFT position, measure the voltage between ground and exterior mirror: <ul style="list-style-type: none"> <li>♦ <b>LH:</b> C516-3, circuit 942 (RD/OG), harness side.</li> <li>♦ <b>RH:</b> C622-3, circuit 944 (DG/OG), harness side.</li> </ul> </li> </ul> <div data-bbox="352 1628 576 1809" data-label="Diagram"> <p>N0068494</p> </div> <ul style="list-style-type: none"> <li><b>Is the voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> CHECK the RH or LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new RH or LH exterior mirror. REFER to <u>Exterior Mirror</u> in this section. If the jumper harness is OK, INSTALL a new RH or LH exterior mirror motor. REFER to <u>Exterior Mirror Motor</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> GO to <u>C5</u> .</p>

### Pinpoint Test D: The Heated Exterior Mirror is Inoperative

Refer to Wiring Diagrams Cell 56 , Heated Window for schematic and connector information.

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

#### Normal Operation

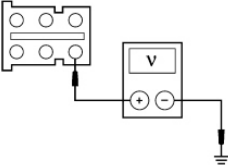

With the engine running and the rear window defrost system ON, the LH and RH exterior mirror glass receives voltage from Battery Junction Box (BJB) fuse 24 (10A) through circuit 59 (DG/VT) and ground through circuit 57 (BK).

#### This pinpoint test is intended to diagnose the following:

- Fuse
- Heated exterior mirror glass
- Heated exterior mirrors
- Wiring, terminals or connectors

### PINPOINT TEST D: THE HEATED EXTERIOR MIRROR IS INOPERATIVE

Test Step	Result / Action to Take
<b>D1 CHECK THE OPERATION OF THE REAR WINDOW DEFROST SYSTEM</b>	
	<b>Yes</b>

<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Press the rear window defrost switch to the ON position.</li> <li>• Place a hand on the rear window to verify that the rear window heats up.</li> <li>• <b>Does the rear window defrost system operate?</b></li> </ul>	<p>GO to <u>D2</u> .</p> <p><b>No</b> REFER to <u>Section 501-11</u> to continue diagnosis of the heated rear window system.</p>
<b>D2 CHECK THE VOLTAGE TO THE EXTERIOR MIRRORS</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Inoperative Exterior Mirror C516 (LH) or C622 (RH).</li> <li>• Ignition ON.</li> <li>• Press the rear window defrost switch to the ON position.</li> <li>• Measure the voltage between ground and inoperative exterior mirror: <ul style="list-style-type: none"> <li>♦ <b>LH:</b> C516-6 circuit 59 (DG/VT), harness side.</li> <li>♦ <b>RH:</b> C622-6, circuit 59 (DG/VT), harness side.</li> </ul> </li> </ul>  <p>A0042265</p> <ul style="list-style-type: none"> <li>• <b>Is the voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <u>D3</u> .</p> <p><b>No</b> VERIFY the BJB fuse 24 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. TEST the system for normal operation.</p>
<b>D3 CHECK THE EXTERIOR REAR VIEW MIRROR GROUND CIRCUIT FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Measure the resistance between ground and exterior mirror: <ul style="list-style-type: none"> <li>♦ <b>LH:</b> C516-4, circuit 57 (BK), harness side.</li> <li>♦ <b>RH:</b> C622-4, circuit 57 (BK), harness side.</li> </ul> </li> </ul>	<p><b>Yes</b> CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror glass for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH or RH exterior mirror. REFER to <u>Exterior Mirror</u> in this section. If the jumper harness is OK, INSTALL a new LH or RH exterior mirror glass. REFER to <u>Exterior Mirror Glass</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

A0042266

- Is the resistance less than 5 ohms?

**Rear View Mirrors - Interior**

## Special Tool(s)

	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
---	---

**Principles of Operation****Interior Auto-Dimming Rear View Mirror**

The interior auto-dimming rear view mirror automatically reduces the glare caused by headlamps reflecting in the interior rear view mirror. The auto-dimming feature is disabled when the vehicle is in REVERSE. Power is supplied to the interior auto-dimming mirror when the ignition is in the RUN or ACC position.

The interior auto-dimming rear view mirror has 2 photoelectric sensors that detect forward and rearward light conditions, and based on those inputs, adjusts the reflectance level of the interior rear view mirror to eliminate unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior mirror.

When the forward sensor detects daytime conditions, the rearward sensor is inactive, and the mirror glass stays in a high reflectance mode. When the forward sensor detects nighttime conditions, the rearward sensor is active and detects glare from the headlights of vehicles approaching from the rear, or other glare producing light sources. To provide increased visibility when backing up, the interior rear view mirror glass will automatically return to a high reflectance mode whenever the selector lever is placed in REVERSE.

If the forward or rearward sensors are blocked, the auto-dimming interior rear view mirror might not work correctly.

**Inspection and Verification**

**⚠ WARNING:** If equipped with fire suppression system, refer to [Section 100-02B](#) for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

**Visual Inspection Chart**

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Interior rear view mirror</li> </ul>	<ul style="list-style-type: none"> <li>• Central Junction Box (CJB) fuse 9 (7.5A)</li> <li>• Interior auto-dimming rear view mirror</li> </ul>

	<ul style="list-style-type: none"> <li>• Loose or corroded connections</li> <li>• Wiring harness</li> </ul>
--	---

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and GO to Symptom Chart - Interior Mirror or GO to Symptom Chart - NVH.

### Symptom Chart - Interior Mirror

Symptom Chart - Interior Mirror

### Symptom Chart - NVH

Symptom Chart - NVH

**NOTE:** NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

#### ConditionPossible SourcesAction

- The interior mirror vibrates/loose
- Interior mirror mounting loose
- REMOVE the interior mirror. REFER to Interior Rear View Mirror in this section. INSPECT the interior mirror mount for damage. INSTALL the interior mirror, making sure that it is fully seated.

### Pinpoint Tests

#### Pinpoint Test E: The Auto Dimming Mirror Does Not Operate Correctly

Refer to Wiring Diagrams Cell 124, Power Mirrors for schematic and connector information.

#### Normal Operation

The interior auto-dimming mirror receives voltage from Central Junction Box (CJB) fuse 9 (7.5A) through circuit 964 (DB/LG) and ground from circuit 57 (BK). When the vehicle is placed in REVERSE, voltage is sent to the interior mirror through circuit 140 (BK/PK) and the interior mirror will turn the dimming feature off. There are 2 photoelectric sensors: one in the front of the interior rear view mirror and one mounted on the glass side of the mirror. If the sensors are blocked, the interior auto-dimming mirror might not work correctly. Always verify both sensors are not physically blocked before attempting to diagnose auto-dimming mirror

concerns.

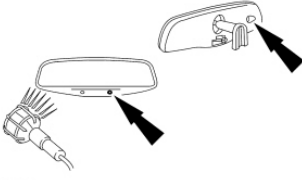

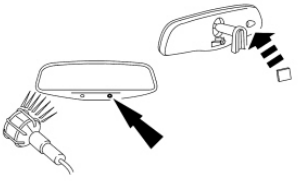

**This pinpoint test is intended to diagnose the following:**

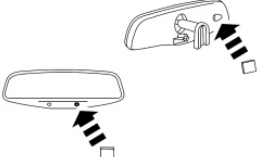

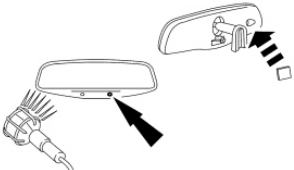

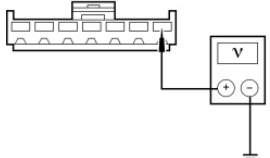

- Fuse
- Interior auto-dimming mirror
- Wiring, terminals or connectors

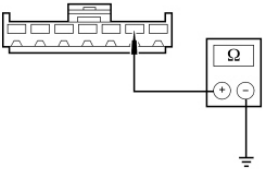

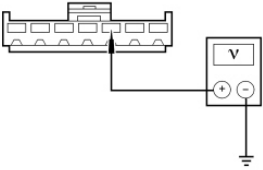

#### **PINPOINT TEST E: THE AUTO-DIMMING MIRROR DOES NOT OPERATE CORRECTLY**

**NOTE:** If the Transmission Range (TR) sensor is malfunctioning and the backup lamps are on all the time or do not turn on, the auto-dimming interior mirror will not darken or return to normal view.

<b>Test Step</b>	<b>Result / Action to Take</b>
<b>E1 CHECK THE OPERATION OF THE BACKUP LAMPS</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Move the selector lever through the entire range.</li> <li>• <b>Do the backup lamps illuminate only in REVERSE?</b></li> </ul>	<p><b>Yes</b> GO to <u>E2</u> .</p> <p><b>No</b> REFER to <u>Section 417-01</u> to diagnose the backup lamps.</p>
<b>E2 VERIFY THE FORWARD AND REARWARD FACING SENSORS ARE NOT BLOCKED</b>	
<ul style="list-style-type: none"> <li>• Visually verify the forward and rearward facing sensors are not blocked. Sources of blockage can include: <ul style="list-style-type: none"> <li>◆ stickers, window decals, or tags.</li> <li>◆ fold-down screens for TVs or DVD players.</li> <li>◆ non-OEM window tinting.</li> </ul> </li> <li>• <b>Are either of the sensors blocked?</b></li> </ul>	<p><b>Yes</b> If possible, REMOVE the blockage. TEST the system for normal operation. If the blockage cannot be removed, REVIEW the operation of the interior auto-dimming mirror with the customer.</p> <p><b>No</b> GO to <u>E3</u> .</p>
<b>E3 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - DAYLIGHT CONDITIONS</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Use a bright lamp to illuminate the forward facing sensor and the rearward facing sensor. The mirror should adjust to a high reflectance mode (mirror will be clear).</li> </ul>	<p><b>Yes</b> GO to <u>E4</u> .</p> <p><b>No</b> INSTALL a new interior mirror. REFER to <u>Interior Rear View Mirror</u> in this section. TEST the system for normal operation.</p>

 <p>N0057545</p> <ul style="list-style-type: none"> <li>• Does the mirror adjust to the high reflectance (clear) mode?</li> </ul>	
<b>E4 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHTTIME CONDITIONS WITH GLARE</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• <b>NOTE:</b> Covering the sensor with a finger or hand is not adequate.</li> <li>• Simulate nighttime conditions with glare: <ul style="list-style-type: none"> <li>♦ cover the forward-facing sensor with black electrical tape or other dark material.</li> <li>♦ illuminate the rearward-facing sensor. The mirror should darken to a lower reflectance mode.</li> </ul> </li> </ul>  <p>N0057546</p> <ul style="list-style-type: none"> <li>• Does the mirror darken to a lower reflectance (darker) mode?</li> </ul>	<p><b>Yes</b> GO to <u>E5</u> .</p> <p><b>No</b> GO to <u>E7</u> .</p>
<b>E5 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHTTIME CONDITIONS WITHOUT GLARE</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• <b>NOTE:</b> Covering the sensor with a finger or hand is not adequate.</li> <li>• Simulate nighttime conditions without glare: <ul style="list-style-type: none"> <li>♦ cover the forward-facing sensor with black electrical tape or other dark material.</li> <li>♦ cover the rearward-facing sensor. The mirror should adjust to the high reflectance mode.</li> </ul> </li> </ul>	<p><b>Yes</b> GO to <u>E6</u> .</p> <p><b>No</b> GO to <u>E7</u> .</p>

 <p>N0057547</p> <ul style="list-style-type: none"> <li>• Does the mirror adjust to the high reflectance (clear) mode?</li> </ul>	
<p><b>E6 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHTTIME CONDITIONS WITH THE VEHICLE IN REVERSE</b></p>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• <b>NOTE:</b> Covering the sensor with a finger or hand is not adequate.</li> <li>• Simulate nighttime conditions with glare: <ul style="list-style-type: none"> <li>◆ cover the forward-facing sensor with black electrical tape or other dark material.</li> <li>◆ illuminate the rearward-facing sensor.</li> </ul> </li> </ul>  <p>N0057546</p> <ul style="list-style-type: none"> <li>• Select REVERSE.</li> <li>• Did the mirror adjust to a high reflectance (clear) mode?</li> </ul>	<p><b>Yes</b> The system is operating normally at this time. REVIEW operation of the interior auto-dimming mirror feature with the customer.</p> <p><b>No</b> GO to <u>E7</u> .</p>
<p><b>E7 CHECK CIRCUIT 964 (DB/LG) FOR AN OPEN</b></p>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Interior Auto-dimming Mirror C911.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between interior auto-dimming mirror C911-1, circuit 964 (DB/LG), harness side and ground.</li> </ul>  <p>A0073174</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	<p><b>Yes</b> GO to <u>E8</u> .</p> <p><b>No</b> VERIFY CJB fuse 9 (7.5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. TEST the system for normal operation.</p>

E8 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Measure the resistance between interior auto-dimming mirror C911-2, circuit 57 (BK), harness side and ground.</li> </ul>  <p>A0073175</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p><b>Yes</b> GO to <u>E9</u> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>
E9 CHECK CIRCUIT 140 (BK/PK) FOR AN OPEN	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Select REVERSE.</li> <li>• Measure the voltage between interior auto-dimming mirror C911-3, circuit 140 (BK/PK), harness side and ground.</li> </ul>  <p>A0073178</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	<p><b>Yes</b> INSTALL a new interior rear view mirror. REFER to <u>Interior Rear View Mirror</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

**Exterior Mirrors - Exploded View**

Item	Part Number	Description
1	-	Water shield
2	-	Electrical connector (part of 14A005)
3	-	Pin-type retainer (1 required)
4	N621906	Exterior mirror nuts (3 required)
5	17682	Exterior mirror assembly
6	17K707	Exterior mirror glass
7	-	Exterior mirror motor screws (3 required)
8	17D696	Exterior mirror motor
9	17D742	Exterior mirror cover

1. For additional information, refer to the procedures in this section.

## **Exterior Mirror**

### **Removal and Installation**

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#) .
  2. Position the water shield aside.
  3. Remove the pin-type retainer.
  4. Through the door opening, disconnect the power exterior mirror electrical connector.
  5. Remove the 3 nuts and the exterior mirror.
    - To install, tighten to 7 Nm (62 lb-in).
  6. To install, reverse the removal procedure.
-

---

**Exterior Mirror Glass****Removal and Installation**

1. Push in the upper edge of the exterior mirror glass to the maximum travel.

2. **⚠ WARNING:** Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.

Gently pull outward until the exterior mirror glass is released.

- If equipped, disconnect the mirror glass electrical connector.

3. To install, reverse the removal procedure.
-

## Exterior Mirror Motor

### Removal and Installation

1. Remove the exterior mirror glass. For additional information, refer to [Exterior Mirror Glass](#) in this section.

2. Remove the exterior mirror motor screws.
    - To install, tighten to 2 Nm (18 lb-in).
  3. Disconnect the electrical connectors and remove the motor.
  4. To install, reverse the removal procedure.
-

## Exterior Mirror Cover

### Removal

1. Position the exterior mirror glass in the full downward position.
2. Using a suitable tool, release the 2 locking tabs from the exterior mirror cover.

3. Position the exterior mirror glass in the full in position.
4. Using a suitable tool, release the locking tab and remove the exterior mirror cover.

### Installation

1. Position the exterior mirror cover on the exterior mirror.
  2. Place a hand against the back of the exterior mirror cover and press the cover in place until it is fully seated.
-

**Exterior Mirror Control Switch**

Item	Part Number	Description
1	17B676	Exterior mirror control switch
2	14527	Window regulator switch plate
3	-	Electrical connectors (part of 14A005)

**Removal and Installation**

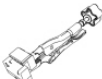

1. Lift the front of the window regulator switch plate from the front door trim panel and position the switch plate aside.
2. Release the 2 locking tabs and remove the exterior mirror control switch.
  - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

4	-	Mirror type 4

**Removal**

## Mirror Type 1

**NOTICE:** The windshield must be at room temperature. Otherwise, damage to the windshield glass may occur.

**NOTE:** [Click here to view a video version of this procedure.](#)

1. If equipped.

- 2.

3. **NOTICE:** Make sure the Mirror Remover is fully inserted into the interior rear view mirror mount access hole. Otherwise, damage to the windshield glass may occur.

4. Using a closed hand, bump the adjustment handle of the Mirror Remover to slide the mirror upward on the mirror mount.

- 5.

## Mirror Type 2

- 6.

## Mirror Type 3

- 7.

8.

9.

#### Mirror Type 4

10.

#### Mirror Identification

11.

12. **NOTICE:** To prevent damage to the mirror or base, rotate the mirror base with hands only do not use tools.

**NOTICE:** To prevent damage to the mirror wiring, do not rotate the mirror head beyond 180 degrees.

## Installation

### Mirror Type 1

**NOTE:** [Click here to view a video version of this procedure.](#)

### Mirror Identification

1. Slide the interior rear view mirror mount over the windshield bracket from the top.

2. **NOTE:** An audible click will be heard as the mirror fully seats.

3. If equipped.

4. If equipped with compass module, check the compass zone and calibration. Refer to General Procedures in Section 413-01 or Section 419-11.

### Mirror Type 2

5.

6. If equipped with a compass module which requires calibration, check the compass zone adjustment and calibration. Refer to General Procedures in Section 413-01 or Section 419-11.

### Mirror Type 3

7. To install, reverse the removal procedure.

### Mirror Type 4

8. To install, reverse the removal procedure.
    - If a new mirror has been installed, download the IPM-A configuration information from the scan tool to the new IPM-A .
    - If a new mirror has been installed, perform camera alignment using a scan tool.
-

Seat track-to-cushion frame bolts	20	-	177
Side air bag module nuts	7	-	62

## Seats

### Front Seats

The driver and passenger front seats can be equipped with the following serviceable items:

- Six-way power seat tracks
- Power seat switches attached to the driver and passenger front door panels
- Two-way manual seat tracks
- Power recliner attached to the cushion and backrest frames
- Manual recliners attached to the cushion and backrest frames
- Power lumbar assemblies mounted to the backrest frames
- Power lumbar control switches attached to the seat cushions
- Seat side air bags in the backrest assemblies
- Heated seat cushions and backrests
- Heated seat switches attached to the driver and passenger front door panels
- Armrests mounted to the seat cushion frames (50 percent seats)
- Occupant Classification Sensor (OCS) system (passenger seat cushion only)
- Safety belt buckles attached to the seat tracks

### Power Seat Track

The power seat track motors move the seat horizontally and vertically (front and rear height). The seat track motors are serviceable only as a seat track assembly.

### Power Recliner

The power recliner motor moves the seat backrest backward or forward. The power recliner is a modular design and incorporated into the inertia front seat backrest latch. The power recliner motor is not serviceable separately. If the power recliner needs to be repaired, the entire front seat backrest latch must be installed new.

### Power Lumbar

The driver seat has an electro-mechanical backrest pad adjuster mounted to the backrest frame to provide more lower body displacement. The lumbar switch is located on the side of the seat cushion. The power lumbar includes an electric air compressor and air bladder that inflates or deflates to move the backrest foam pad in and out for lumbar support adjustment.

### Seat Side Air Bag

Driver and passenger seat side air bags are attached to the seat backrest frames. For diagnostic information, or if the seat side air bag has deployed, refer to Section 501-20B.

### Heated Seat

**NOTE:** The heater mat on the front passenger seat cushion is not serviceable separately. If a new heater mat is needed on the front passenger seat cushion, a new OCS system service kit and a new heater mat must be installed. Refer to Section 501-20B .

**NOTE:** If a driver seat heater mat (cushion or backrest) or passenger seat backrest heater mat is faulty, a new foam pad must be installed with the new heater mat. Do not reuse the original foam pad.

The heated seats system includes the following serviceable components:

- Driver and passenger heated seat modules attached underneath the seat cushion frames
- Heater mats attached to the seat cushions and backrests
- Heated seat switches attached to the driver and passenger front door panels

### **Occupant Classification Sensor (OCS)**

The OCS system is standard equipment on all front passenger seats. For information on diagnosing or servicing the OCS system, refer to Section 501-20B .

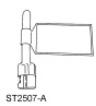

### **Belt Tension Sensor (BTS)**

The Belt Tension Sensor (BTS) is part of the safety belt buckle on the front passenger seat only. It is part of the Supplemental Restraint System (SRS). It connects electrically to the passenger seat wiring harness. For diagnostic information, refer to Section 501-20B . For specific removal and installation information, refer to Section 501-20A .

---

**Seats**

## Special Tool(s)

	Diagnostic Service Tool, Restraint System (2 required) 418-133
	Flex Probe Kit 105-R025C or equivalent
	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

**Restraint System Diagnostic Service Tool Warning**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**Principles of Operation****Front Power Seats**

The driver and front passenger power seat motors are hardwired to the seat control switches on each respective front door trim panel. The seat motor circuits are all normally grounded through the seat control switch (rest position). The seat control switch supplies voltage and ground to the appropriate motor on the seat track or recliner motor (if equipped) when a seat adjustment position is selected.

**Heated Seats**

**NOTE:** The heater mat on the front passenger seat cushion is not serviceable separately. If a new heater mat is needed on the front passenger seat cushion, a new Occupant Classification Sensor (OCS) system service kit and a new heater mat must be installed. Refer to [Section 501-20B](#).

**NOTE:** If a driver seat heater mat (cushion or backrest) or passenger seat backrest heater mat is faulty, a new foam pad must be installed with the new heater mat. Do not reuse the original foam pad.

Vehicles equipped with front heated seats have a heated seat module located under each front seat. The driver and passenger heated seat modules share a common battery voltage supply circuit and a common ignition voltage supply circuit. The engine must be running to operate the heated seat system. When the heated seat switch is pressed, a ground signal is sent to the heated seat module on either the high or low enable circuits to command the system on or off. The heated seat module also supplies ground circuits to the high and low indicators in the heated seat switch. The heated seat module also supplies voltage and ground to the cushion

and backrest heater mats. The backrest and cushion heater mats are connected in parallel and operate together. The heated seat module controls the seat temperature by monitoring resistance of a temperature sensor (thermistor) contained within the cushion heater mat and controls the output current to the heater mats. The heated seat module is designed to maintain seat temperature until the system times-out, is switched off or engine is no longer running. The temperature sensor is not serviceable separately, a new sensor must be installed as part of the cushion heater mat or foam pad.

### Inspection and Verification

**⚠ WARNING:** If equipped with fire suppression system, refer to **Section 100-02B** for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

### Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Loose or damaged seat mounting hardware</li> <li>• Front seat tracks obstructed</li> <li>• Seat at limit(s) of travel</li> <li>• Damaged switch(es)</li> <li>• Damaged seat trim cover</li> <li>• Damaged seat track</li> </ul>	<ul style="list-style-type: none"> <li>• Battery Junction Box (BJB):               <ul style="list-style-type: none"> <li>◆ circuit breaker 601 (20A)</li> <li>◆ fuse 16 (20A)</li> </ul> </li> <li>• Central Junction Box (CJB) fuse(s):               <ul style="list-style-type: none"> <li>◆ 9 (7.5A)</li> <li>◆ 17 (10A)</li> </ul> </li> <li>• Faulty wiring harness</li> <li>• Loose, corroded or damaged connectors</li> <li>• Damaged seat control switch</li> <li>• Damaged lumbar control switch</li> <li>• Damaged heated seat switch</li> <li>• Damaged seat track motor</li> </ul>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom. GO to **Symptom Chart**.

### Symptom Chart

Symptom Chart

### Pinpoint Tests

Refer to Inspection and Verification and the Symptom Chart in this section for direction to the appropriate Pinpoint Test.

**Pinpoint Test A: The Power Seat is Inoperative**

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

**Normal Operation**

The seat control switch is supplied battery voltage on circuit 517 (BK/WH) and is supplied ground on circuit 57 (BK). The seat control switch applies battery voltage and ground directly to one of 3 bi-directional seat track motors, respectively, to move the seat. Toggling the seat control switch in the opposite direction reverses voltage polarity applied to the respective seat motor and moves the seat in the opposite direction.

**This pinpoint test is intended to diagnose the following:**

- Circuit breaker
- Wiring, terminals or connectors
- Seat control switch
- Seat track (motor assembly)

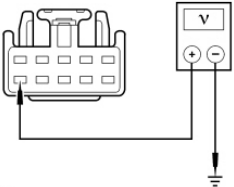

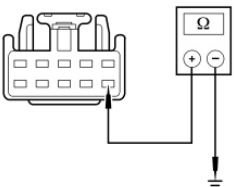

**PINPOINT TEST A: THE POWER SEAT IS INOPERATIVE**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTICE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

Test Step	Result / Action to Take
<b>A1 CHECK THE POWER SEAT OPERATION</b>	
<ul style="list-style-type: none"> <li>• Operate the seat from the seat control switch.</li> <li>• <b>Does the seat move in any direction?</b></li> </ul>	<p><b>Yes</b> VERIFY the symptom. GO to <u>Symptom Chart</u> .</p> <p><b>No</b> GO to <u>A2</u> .</p>
<b>A2 CHECK THE VOLTAGE TO THE SEAT CONTROL SWITCH</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the Supplemental Restraint System (SRS). Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of <u>Section 501-20B</u> .</li> <li>• Disconnect: Driver Seat Side Air Bag C315 or Passenger Seat Side Air Bag C316.</li> <li>• Connect: Restraint System Diagnostic Service Tool 418-133 to Driver Seat Side Air Bag</li> </ul>	<p><b>Yes</b> GO to <u>A3</u> .</p> <p><b>No</b> VERIFY the Battery Junction Box (BJB) circuit breaker 601 (20A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. TEST the system for normal operation.</p>

<p>C315 or Passenger Seat Side Air Bag C316.</p> <ul style="list-style-type: none"> <li>• Disconnect: Driver Seat Control Switch C519 or Passenger Seat Control Switch C627.</li> <li>• <b>⚠ WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.</b></li> <li>• Connect the battery ground cable. Refer to <u>Section 414-01</u> .</li> <li>• Measure voltage between driver seat control switch C519-10, circuit 517 (BK/WH), harness side and ground; or between passenger seat control switch C627-10, circuit 517 (BK/WH), harness side and ground.</li> </ul>  <p>N0078865</p> <p>• Is the voltage greater than 10 volts?</p>	<p>DISCONNECT the battery ground cable. DISCONNECT the restraint system diagnostic service tool from driver seat side air bag module C315 or passenger seat side air bag module C316. CONNECT driver seat side air bag module C315 or passenger seat side air bag module C316. REPOWER the SRS . REFER to <u>Section 501-20B</u> .</p>
<p><b>A3 CHECK CIRCUIT 57 (BK) FOR AN OPEN</b></p> <ul style="list-style-type: none"> <li>• Measure resistance between driver seat control switch C519-6, circuit 57 (BK), harness side and ground; or between passenger seat control switch C627-6, circuit 57 (BK), harness side and ground.</li> </ul>  <p>N0078866</p> <p>• Is the resistance less than 5 ohms?</p>	<p><b>Yes</b> GO to <u>A4</u> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p> <p>DISCONNECT the battery ground cable. DISCONNECT the restraint system diagnostic service tool from driver seat side air bag module C315 or passenger seat side air bag module C316. CONNECT driver seat side air bag module C315 or passenger seat side air bag module C316. REPOWER the SRS . REFER to <u>Section 501-20B</u> .</p>
<p><b>A4 CHECK THE SEAT TRACK FOR AN OBSTRUCTION</b></p> <ul style="list-style-type: none"> <li>• Inspect the seat track for damage or an obstruction.</li> <li>• Is the seat track OK?</li> </ul>	<p><b>Yes</b> INSTALL a new seat control switch. REFER to <u>Seat Control Switch</u> in this section. TEST the system for normal operation.</p> <p>DISCONNECT the battery ground cable.</p>

	<p>DISCONNECT the restraint system diagnostic service tool from driver seat side air bag module C315 or passenger seat side air bag module C316. CONNECT driver seat side air bag module C315 or passenger seat side air bag module C316. REPOWER the SRS . REFER to <u>Section 501-20B</u> .</p> <p><b>No</b> INSTALL a new seat track. REFER to <u>Seat Track</u> in this section. TEST the system for normal operation.</p> <p>DISCONNECT the battery ground cable. DISCONNECT the restraint system diagnostic service tool from driver seat side air bag module C315 or passenger seat side air bag module C316. CONNECT driver seat side air bag module C315 or passenger seat side air bag module C316. REPOWER the SRS . REFER to <u>Section 501-20B</u> .</p>
--	---

### Pinpoint Test B: The Power Seat Does Not Move Horizontally/Vertically - Driver

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

#### Normal Operation

When pressed in 1 of 6 possible directions, the seat control switch supplies battery voltage and ground to horizontal motor circuits 980 (YE/WH) and 981 (RD/WH), front height motor circuits 978 (YE/LB) and 979 (RD/LB) or rear height motor circuits 982 (YE/LG) and 983 (RD/LG). The seat control switch is normally closed to ground on all 6 of the seat motor circuits. When the seat control switch is toggled in one direction to supply voltage to a motor circuit, the opposite motor circuit is already connected to ground through the switch supplying voltage and ground to the motor to move the seat. Toggling the seat control switch in the opposite direction reverses polarity to the motor moving the seat in the opposite direction.

#### **This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Seat control switch
- Power seat motor (seat track)

### PINPOINT TEST B: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY - DRIVER

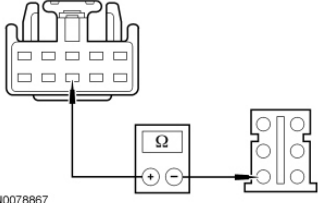

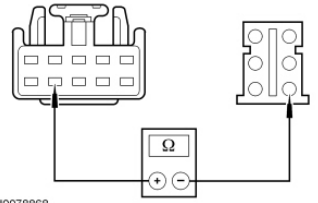

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

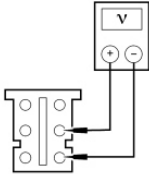

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

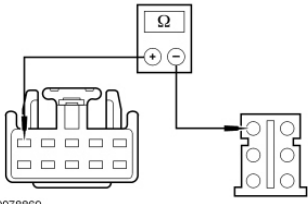

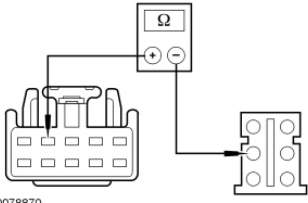

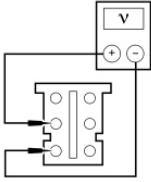

**NOTICE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

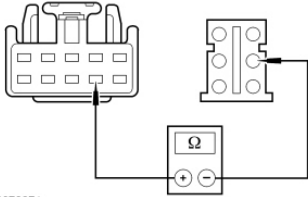

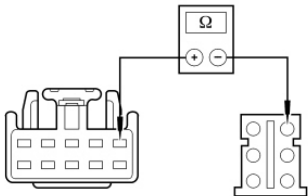

Test Step	Result / Action to Take
<b>B1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION</b>	
<ul style="list-style-type: none"> <li>• Operate the driver power seat forward and rearward.</li> <li>• <b>Does the seat move horizontally?</b></li> </ul>	<p><b>Yes</b> GO to <u>B5</u> .</p> <p><b>No</b> GO to <u>B2</u> .</p>
<b>B2 CHECK THE VOLTAGE TO THE DRIVER SEAT HORIZONTAL MOTOR</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the Supplemental Restraint System (SRS). Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of <u>Section 501-20B</u> .</li> <li>• Disconnect: Driver Seat Side Air Bag C315.</li> <li>• Connect: Restraint System Diagnostic Service Tool 418-133 to Driver Seat Side Air Bag C315.</li> <li>• Disconnect: Driver Power Seat Motor C353.</li> <li>• <b>⚠ WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.</b></li> <li>• Connect the battery ground cable. Refer to <u>Section 414-01</u> .</li> <li>• Measure voltage between driver power seat motor C353-4, circuit 980 (YE/WH), harness side and C353-1, circuit 981 (RD/WH), harness side, while pushing the driver seat control switch forward and rearward.</li> </ul> <div data-bbox="359 1599 585 1742" data-label="Diagram"> </div> <p>A0081768</p> <ul style="list-style-type: none"> <li>• <b>Is the voltage greater than 10 volts when the seat control switch is toggled in both directions and 0 volt in the rest position?</b></li> </ul>	<p><b>Yes</b> INSTALL a new seat track. REFER to <u>Seat Track</u> in this section. TEST the system for normal operation.</p> <p>DISCONNECT the battery ground cable. DISCONNECT the restraint system diagnostic service tool from driver seat side air bag module C315. CONNECT driver seat side air bag module C315. REPOWER the SRS . DISCONNECT the restraint system diagnostic service tool from driver seat side air bag module C315. CONNECT driver seat side air bag module C315. REPOWER the SRS . REFER to <b>Section 501-20B</b> .</p>

### Pinpoint Test C: The Power Seat Does Not Move Horizontally/Vertically - Passenger

Refer to Wiring Diagrams Cell **120** , Power Seats for schematic and connector information.

**Normal Operation**

When pressed in 1 of 6 available directions, the seat control switch supplies battery voltage and ground to horizontal motor circuits 986 (YE/WH) and 987 (RD/WH), front height motor circuits 984 (YE/LB) and 985 (RD/LB) or rear height motor circuits 988 (YE/LG) and 989 (RD/LG). The seat control switch is normally closed to ground on all 6 of the seat motor circuits. When the seat control switch is toggled in one direction to supply voltage to a motor circuit, the opposite motor circuit is already connected to ground through the switch supplying voltage and ground to the motor to move the seat. Toggling the seat control switch in the opposite direction reverses polarity to the motor moving the seat in the opposite direction.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Seat control switch
- Power seat motor (seat track)

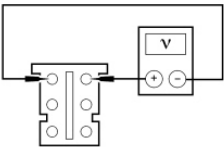

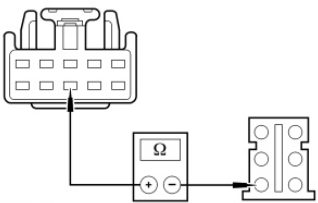

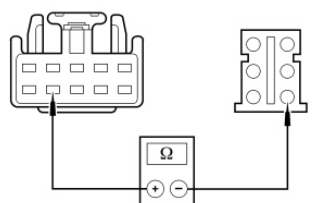

**PINPOINT TEST C: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY - PASSENGER**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

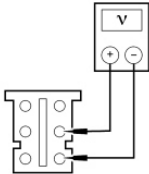

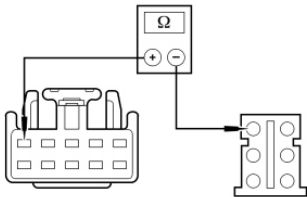

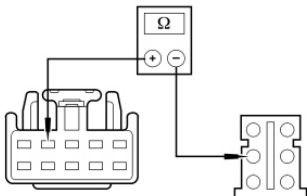

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTICE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

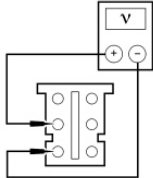

Test Step	Result / Action to Take
<b>C1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION</b>	
<ul style="list-style-type: none"> <li>• Operate the passenger power seat forward and rearward.</li> <li>• <b>Does the seat move horizontally?</b></li> </ul>	<b>Yes</b> GO to <u>C5</u> .  <b>No</b> GO to <u>C2</u> .
<b>C2 CHECK THE VOLTAGE TO THE HORIZONTAL MOTOR</b>

### Pinpoint Test D: The Power Seat Does Not Recline - Driver

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

**Normal Operation**

The seat control switch is supplied battery voltage on circuit 517 (BK/WH) and is supplied ground on circuit 57 (BK). When forward or rearward recliner positions are selected on the seat control switch, voltage and ground is applied to recliner motor circuits 918 (GY) and 919 (GY/BK) to move the seat backrest. When toggled in the opposite direction, the seat control switch reverses voltage polarity to the recliner motor and moves the seat backrest in the opposite direction.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Seat control switch
- Recliner assembly

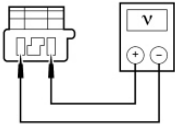

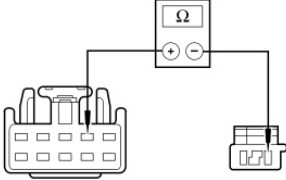

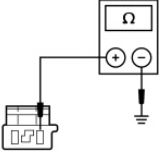

**PINPOINT TEST D: THE POWER SEAT DOES NOT RECLINE - DRIVER**

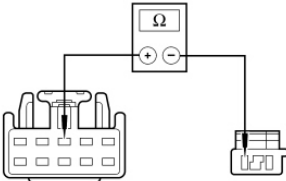

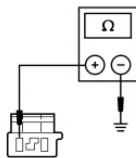

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTICE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

<p><b>E5 CHECK CIRCUIT 919 (GY/BK) FOR A SHORT TO GROUND</b></p>	

- Disconnect: Passenger Seat Control Switch C627.
- Measure resistance between seat backrest power recline motor C338-2, circuit 919 (GY/BK), harness side and ground.

AR2034-A

- Is the resistance greater than 10,000 ohms?

**Yes**

INSTALL a new seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation.

DISCONNECT the battery ground cable. DISCONNECT the restraint system diagnostic service tool from passenger seat side air bag module C316. CONNECT passenger seat side air bag module C316. REPOWER the SRS . REFER to Section 501-20B .

**No**

REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. DISCONNECT the restraint system diagnostic service tool from passenger seat side air bag module C316. CONNECT passenger seat side air bag module C316. REPOWER the SRS . REFER to Section 501-20B .

**Pinpoint Test F: The Power Seat Moves But is Noisy****Normal Operation**

The power seat should move quietly in the forward, rearward, front up/down and rear up/down directions during operation. Some noise is acceptable. Compare the noise to a similar vehicle for reference.

**This pinpoint test is intended to diagnose the following:**

- Seat track alignment
- Seat track obstruction
- Seat track

**PINPOINT TEST F: THE POWER SEAT MOVES BUT IS NOISY**

Test Step	Result / Action to Take
<b>F1 CHECK THE SEAT TRACK ALIGNMENT</b>	
<ul style="list-style-type: none"> <li>• Check alignment of the seat track to the floor and seat.</li> <li>• Is the track alignment OK?</li> </ul>	<p><b>Yes</b> GO to <u>F2</u> .</p> <p><b>No</b> ALIGN seat track to the floor and seat. TEST the system for normal operation.</p>

<b>F2 CHECK THE SEAT TRACK INTEGRITY</b>	
<ul style="list-style-type: none"> <li>While operating the seat, inspect the seat track for binding and damage.</li> <li><b>Is the seat track OK?</b></li> </ul>	<p><b>Yes</b> GO to <u>F3</u> .</p> <p><b>No</b> INSTALL a new seat track. REFER to <u>Seat Track</u> in this section. TEST the system for normal operation.</p>
<b>F3 CHECK THE SEAT MOTOR INTEGRITY</b>	
<ul style="list-style-type: none"> <li>While operating the seat, listen for excessive seat motor noise. Compare the noise to a similar vehicle for reference.</li> <li><b>Is the seat motor OK?</b></li> </ul>	<p><b>Yes</b> Allow the customer to compare to a similar vehicle to determine the amount of motor noise is product characteristic. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new front seat track. REFER to <u>Seat Track</u> in this section. TEST the system for normal operation.</p>

**Pinpoint Test G: The Power Seat Moves But is Loose****Normal Operation**

Power seat movement should be smooth and the seat cushion should not rock during or after operation.

**This pinpoint test is intended to diagnose the following:**

- Seat track fastening hardware
- Seat track

**PINPOINT TEST G: THE POWER SEAT MOVES BUT IS LOOSE**

Test Step	Result / Action to Take
<b>G1 CHECK THE SEAT MOUNTING FASTENERS</b>	
<ul style="list-style-type: none"> <li>Check for loose seat mounting fasteners and the condition of the seat track.</li> <li><b>Are the seat mounting fasteners tight and the seat track OK?</b></li> </ul>	<p><b>Yes</b> IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.</p> <p><b>No</b> TIGHTEN all seat mounting fasteners to specification. TEST the system for normal operation.</p>

**Pinpoint Test H: The Power Seat Does Not Make Full Travel****Normal Operation**

The power seat should travel fully horizontal (forward/rearward) and vertical (front up/down and rear up/down).

**This pinpoint test is intended to diagnose the following:**

- Seat track obstruction
- Seat track

**PINPOINT TEST H: THE POWER SEAT DOES NOT MAKE FULL TRAVEL**

Test Step	Result / Action to Take
<b>H1 CHECK THE SEAT TRACK FOR AN OBSTRUCTION</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Remove the seat and depower the Supplemental Restraint System (SRS). Refer to <u>Seat - Front</u> in this section.</li> <li>• Inspect the seat track components for any obstructions.</li> <li>• <b>Is the seat track clear of obstruction?</b></li> </ul>	<p><b>Yes</b> IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.</p> <p>REPOWER the SRS . REFER to <u>Section 501-20B</u> .</p> <p><b>No</b> REMOVE the obstruction(s) from the track(s). TEST the system for normal operation.</p> <p>REPOWER the SRS . REFER to <u>Section 501-20B</u> .</p>

**Pinpoint Test I: The Power Lumbar is Inoperative - Driver**

Refer to Wiring Diagrams Cell 122 , Power Lumbar Seats for schematic and connector information.

**Normal Operation**

The lumbar control switch is supplied battery voltage on circuit 517 (BK/WH). When the lumbar control switch is toggled in one direction, battery voltage is applied directly to a compressor in the seat backrest lumbar assembly from circuit 1094 (PK). The lumbar compressor is connected directly to ground circuit 57 (BK). When voltage is applied to the compressor motor from the lumbar control switch, air is pumped into the lumbar bladder expanding the backrest foam pad. Toggling the switch to the opposite position applies voltage to a solenoid valve coil in the compressor from circuit 1097 (BN) to release air from the lumbar bladder and the backrest foam pad relaxes.

**This pinpoint test is intended to diagnose the following:**

- Circuit breaker
- Wiring, terminals or connectors
- Lumbar control switch
- Lumbar assembly

**PINPOINT TEST I: THE POWER LUMBAR IS INOPERATIVE - DRIVER**

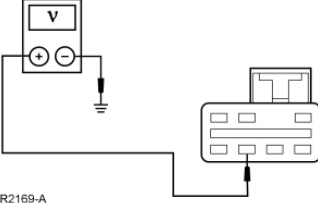

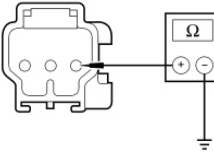

**⚠ WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to**

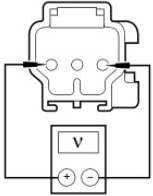

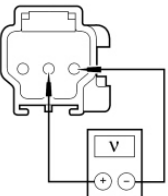

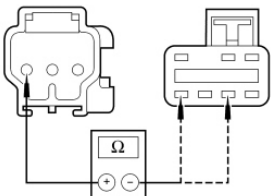

follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

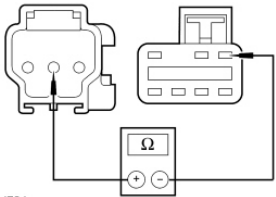

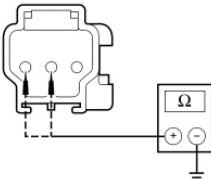

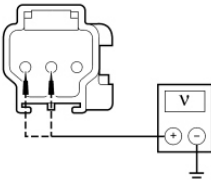

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTICE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

Test Step	Result / Action to Take
<b>I1 CHECK THE LUMBAR COMPRESSOR OPERATION</b>	
<ul style="list-style-type: none"> <li>• Operate the switch to inflate the lumbar.</li> <li>• <b>Does the lumbar compressor operate?</b></li> </ul>	<p><b>Yes</b> GO to <u>I2</u> .</p> <p><b>No</b> GO to <u>I3</u> .</p>
<b>I2 CHECK FOR AIRFLOW FROM THE LUMBAR COMPRESSOR</b>	
<ul style="list-style-type: none"> <li>• Disconnect the air hose from the lumbar compressor fitting.</li> <li>• Operate the switch to inflate the lumbar and check for air from the compressor fitting.</li> <li>• <b>Is air blowing from the lumbar compressor fitting?</b></li> </ul>	<p><b>Yes</b> CHECK the hoses for leaks, disconnection or obstruction. ### Pinpoint Test K: The Heated Seat is Inoperative - Driver

Refer to Wiring Diagrams Cell [119](#) , Climate Controlled Seats for schematic and connector information.

#### Normal Operation

The heated seat module is supplied battery voltage and switched ignition voltage from circuits 1048 (LB/WH) and 1040 (RD/BK). The heated seat is activated when the heated seat switch supplies a ground signal to one of 2 input circuits into the heated seat module. Input circuit 1020 (DG/VT) activates the system to hi or off. Input circuit 1255 (WH/RD) activates the system to low or off. Once activated, the heated seat module supplies voltage and ground to heater mat circuits 1064 (YE/LB) and 1065 (WH/LB) to heat the seat cushion and backrest. The heated seat module monitors circuits 1060 (BK/LB) and 1061 (BN/LB) from the temperature sensor in the cushion heater mat to maintain the seat temperature. The system will remain on until the module times-out or is switched off.

#### This pinpoint test is intended to diagnose the following:

- Fuse(s)

- Wiring, terminals or connectors
- Heated seat switch
- Heater mat
- Heated seat module

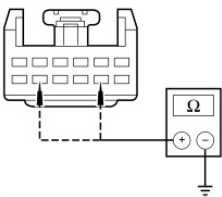

**PINPOINT TEST K: THE HEATED SEAT IS INOPERATIVE - DRIVER**

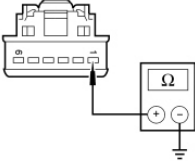

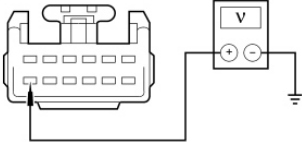

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

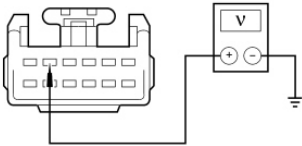

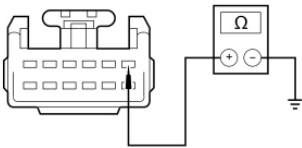

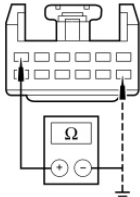

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

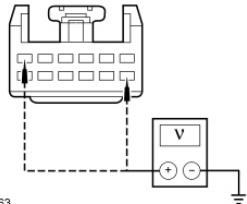

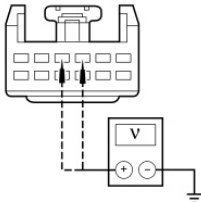

**NOTICE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

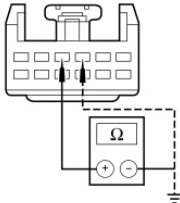

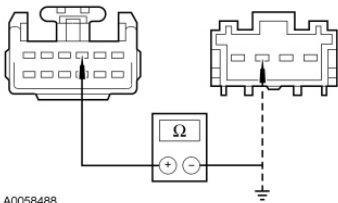

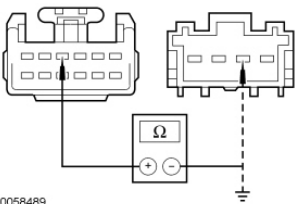

**NOTE:** If a driver seat heater mat (cushion or backrest) is faulty, a new foam pad must be installed with the new heater mat. Do not reuse the original foam pad.

--	---

### Pinpoint Test L: The Heated Seat is Inoperative - Passenger

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

#### Normal Operation

The heated seat module is supplied battery voltage and switched ignition voltage on circuits 1048 (LB/WH) and 1040 (RD/BK). The heated seat is activated when the heated seat switch supplies a ground signal to one of 2 input circuits into the heated seat module. Input circuits 581 (RD) and 1020 (DG/VT) activate the system hi or off. Input circuits 1256 (WH/YE) and 1255 (WH/RD) activate the system to low or off. Once activated, the heated seat module supplies voltage and ground to the heater mat circuits 1064 (YE/LB) and 1065 (WH/LB) to heat the seat cushion and backrest. The heated seat module monitors circuits 1060 (BK/LB) and 1061 (BN/LB) from the temperature sensor in the cushion heater mat to maintain the seat temperature. The system will remain on until the module times-out or is switched off.

#### This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Heated seat switch
- Heater mat
- Heated seat module

### PINPOINT TEST L: THE HEATED SEAT IS INOPERATIVE - PASSENGER

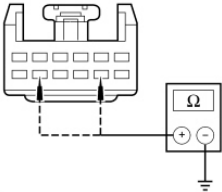

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

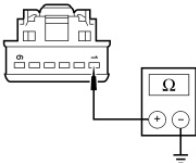

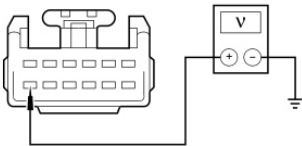

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

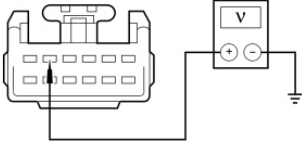

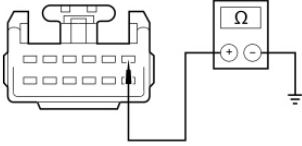

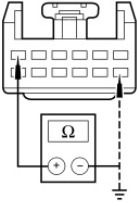

**NOTICE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

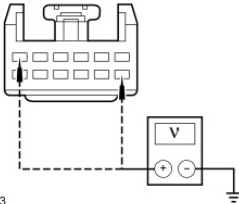

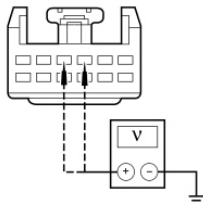

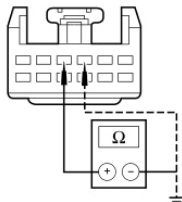

**NOTE:** The heater mat on the front passenger seat cushion is not serviceable separately. If a new heater mat is needed on the front passenger seat cushion, a new Occupant Classification Sensor (OCS) system service kit and a new heater mat must be installed. Refer to Section 501-20B.

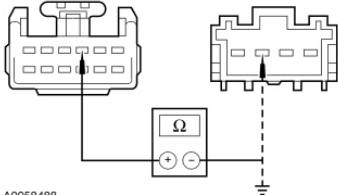

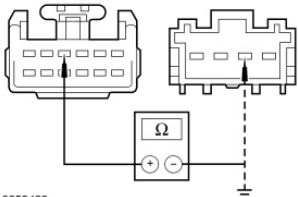

**NOTE:** If a passenger seat backrest heater mat is faulty, a new foam pad must be installed with the new heater mat. Do not reuse the original foam pad.

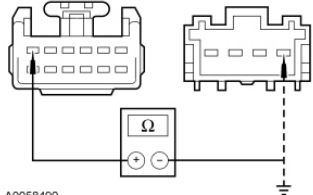

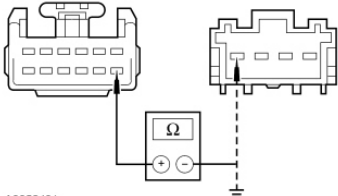

Test Step	Result / Action to Take
<b>L1 CHECK THE HEATED SEAT SWITCH AND CIRCUIT RESISTANCE</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the Supplemental Restraint System (SRS). Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of <u>Section 501-20B</u>.</li> <li>• Disconnect: Passenger Seat Side Air Bag C316.</li> <li>• Connect: Restraint System Diagnostic Service Tool to Passenger Seat Side Air Bag C316.</li> <li>• Disconnect: Passenger Heated Seat Module C329.</li> <li>• Measure resistance between passenger heated seat module C329-8, circuit 581 (RD), and C329-11, circuit 1256 (WH/YE), harness side and ground while pressing the heated seat switch.</li> </ul>  <p>A0049205</p> <ul style="list-style-type: none"> <li>• Are the resistances less than 5 ohms when the heated seat switch is pressed?</li> </ul>	<p><b>Yes</b> GO to <u>L3</u>.</p> <p><b>No</b> GO to <u>L2</u>.</p>
<b>L2 CHECK THE HEATED SEAT SWITCH GROUND CIRCUIT 57 (BK)</b>	
<ul style="list-style-type: none"> <li>• Disconnect: Passenger Heated Seat Switch C630.</li> <li>• Measure resistance between passenger heated seat switch C630-1, circuit 57 (BK), harness side and ground.</li> </ul>	<p><b>Yes</b> INSTALL a new heated seat switch. REFER to <u>Heated Seat Switch</u> in this section. TEST the system for normal operation.</p> <p>DISCONNECT the battery ground cable. A0048777

- Is the resistance between 0.6 and 0.9 ohm?

REPOWER the SRS . REFER to Section 501-20B .

**No**

INSTALL a new passenger seat back heater. TEST the system for normal operation.

DISCONNECT the battery ground cable. DISCONNECT the restraint system diagnostic service tool from passenger seat side air bag module C316. CONNECT passenger seat side air bag module C316.

REPOWER the SRS . REFER to Section 501-20B .

### Pinpoint Test M: The Heated Seat is Inoperative - Driver, Does Not Operate in High

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

#### Normal Operation

The heated seat is activated when the heated seat switch sends a ground signal to the heated seat module input from circuit 1020 (DG/VT) to activate hi heat or off. The system will remain on until the module times-out or is switched off.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Heated seat switch
- Heated seat module

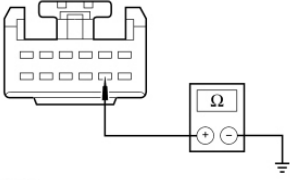

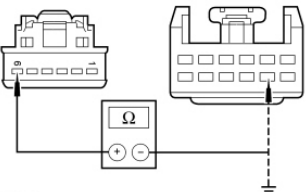

#### PINPOINT TEST M: THE HEATED SEAT IS INOPERATIVE - DRIVER, DOES NOT OPERATE IN HIGH

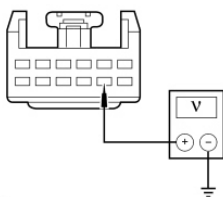

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTICE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**Seat - Front****NOTE:** Driver seat shown, passenger similar.

Item	Part Number	Description
1	-	Front seat
2	N621945/ N621940	Seat track-to-floor nuts (inboard/outboard)
3	611B76/611B70	Center safety belt and tongue/safety belt and buckle
4	N807000	Seat track-to-floor bolt (2 required)
5	61748/61749	Seat track cover (inboard/outboard) (4 required)
6	-	Electrical connectors (part of 14A699)

**Removal**

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the seat to allow access to the front and rear retainers.
2. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

3. Remove the 2 rear front seat track covers.
4. Remove the 2 seat-to-floor nuts.
5. Remove the 2 seat track front covers.
6. Remove the 2 seat-to-floor bolts.
7. Disconnect the electrical connectors and detach the wiring harness pin-type retainer from the seat track.

8. **NOTICE:** Use care when handling the seat and track assembly. Dropping the assembly or sitting on a seat not secured in the vehicle may result in damaged components.

Remove the seat from the vehicle.

## Installation

1. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

Position the seat in the vehicle and safety belt anchor to the seat mounting stud.

2. Connect the electrical connectors and attach the wiring harness pin-type retainer to the seat track.

3. Install the inboard seat-to-floor nut.
  - Before installing the inboard seat-to-floor nut, make sure the center seat safety belt buckle anchor is correctly positioned to the seat track and seat mounting stud.
  - Tighten to 80 Nm (59 lb-ft).
4. Install the outboard seat-to-floor nut.
  - Tighten to 25 Nm (18 lb-ft).
5. Install the 2 rear front seat track covers.
6. Install the 2 seat-to-floor bolts.
  - Tighten to 25 Nm (18 lb-ft).
7. Install the 2 seat track front covers.

8. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
-

34	63100	Cushion frame
35	603A06	Cushion support spring (6 required)
36	63226	Seat cushion support

1. For additional information, refer to the procedures in this section.

**Seat Backrest - Front****Removal**

**NOTE:** Note all wire harness routing for correct installation.

**All vehicles**

1. Position the seat all the way forward and up.
2. Depower the Supplemental Restraint System (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B.

**Police vehicles**

3. Pull the zippers out from underneath the material, unzip both zippers and position the backrest trim cover up to access the backrest trim panel.

4. Remove the backrest trim panel.
  1. Remove the 2 screws located at the bottom of the backrest trim panel.
  2. Pull out at the bottom and slide the backrest trim panel up to disengage the 2 upper retaining hooks.

**Non-police vehicles**

5. Release the backrest trim cover J-clips.
  - Release the lower J-clip first and then release the 2 side J-clips.

### Vehicles with power lumbar

6. Release the cushion trim cover rear J-clip.

7. Release the cushion trim cover rear corner J-clip.
8. Disconnect the power lumbar electrical connector.

### All vehicles

9. If equipped, disconnect the backrest heated seat electrical connector.
10. Disconnect the seat side air bag module electrical connector and route it through the seat cushion.
11. Remove the recliner-to-backrest bolts.
12. Remove the pivot bolt.
13. Remove the seat backrest.
  - Route out any wire harness(es) that passes through the seat cushion.

### Installation

#### All vehicles

1. Position the seat backrest.
  - Route any wire harness(es) back through the seat cushion as noted during removal.
2. Install the pivot bolt.
  - Tighten to 45 Nm (33 lb-ft).
3. Install the recliner-to-backrest bolts.
  - Tighten to 55 Nm (41 lb-ft).
4. Connect and attach the seat side air bag electrical connector.
5. If equipped, connect the backrest heated seat electrical connector.

### Vehicles with power lumbar

6. Connect the power lumbar electrical connector.
7. Attach the cushion trim cover rear corner J-clip.
8. Attach the cushion trim cover rear J-clip.

### Non-police vehicles

9. **NOTE:** Note the alignment of the 2 side J-clips at the top of the seat to avoid bunching.

Attach the backrest trim cover J-clips.

- Attach the 2 side J-clips first and then attach the lower J-clip.

### Police vehicles

10. **NOTICE:** Inspect the seat backrest trim panel retaining hooks for damage. If damaged, install a new seat backrest trim panel.

Install the backrest trim panel.

1. Angle the top of the seat backrest trim panel inward and down to engage the 2 upper retaining hooks to the backrest frame.
2. Push in on the lower backrest trim panel and install the 2 screws.

11. Pull the seat backrest material down, zip both zippers and tuck the zippers under the material.

### All vehicles

12. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
-

**Seat Recliner - Manual****Removal and Installation****Police vehicles**

1. Pull the zippers out from underneath the material, unzip both zippers and position the backrest trim cover up to access the backrest trim panel.

2. Remove the backrest trim panel.
  1. Remove the 2 screws located at the bottom of the backrest trim panel.
  2. Pull out at the bottom and slide the backrest trim panel up to disengage the 2 upper retaining hooks.

**Non-police vehicles**

3. Release the backrest trim cover J-clips.
  - Release the lower J-clip first and then release the 2 side J-clips.

**All vehicles**

4. Remove the backrest recliner handle.
5. Release the side outboard cushion J-clips.
6. Release the cushion trim cover rear J-clip.

7. Release the cushion trim cover rear corner J-clip.
  8. Remove the recliner assembly. For additional information, refer to Seat - Exploded View, Front in this section.
    - Remove the 2 recliner-to-backrest bolts.
      - ◆ To install, tighten to 55 Nm (41 lb-ft).
    - Remove the 2 recliner-to-seat track bolts.
      - ◆ To install, tighten to 55 Nm (41 lb-ft).
    - Remove the recliner assembly.
  9. To install, reverse the removal procedure.
-

**Seat Recliner - Power****Removal and Installation**

**NOTE:** The power seat backrest recliner assembly must be installed as a new unit. Repair of the power seat backrest recliner assembly components is not acceptable and should not be attempted.

**Police vehicles**

1. Pull the zippers out from underneath the material, unzip both zippers and position the backrest trim cover up to access the backrest trim panel.

2. Remove the backrest trim panel.
  1. Remove the 2 screws located at the bottom of the backrest trim panel.
  2. Pull out at the bottom and slide the backrest trim panel up to disengage the 2 upper retaining hooks.

**Non-police vehicles**

3. Release the backrest trim cover J-clips.
  - Release the lower J-clip first and then release the 2 side J-clips.

**All vehicles**

4. Release the side outboard cushion J-clip.

5. Release the cushion trim cover rear J-clip.

6. Release the cushion trim cover rear corner J-clip.

7. Disconnect the lumbar assembly electrical connector.

8. Remove the recliner assembly. For additional information, refer to Seat - Exploded View, Front in this section.

- Remove the 2 recliner-to-backrest bolts.
  - ◆ To install, tighten to 55 Nm (41 lb-ft).
- Remove the 2 recliner-to-seat track bolts.
  - ◆ To install, tighten to 55 Nm (41 lb-ft).
- Remove the recliner assembly.

9. To install, reverse the removal procedure.

---

## Lumbar Assembly

### Removal

**NOTE:** Driver side shown, passenger similar.

#### Police vehicles

1. Pull the zippers out from underneath the material, unzip both zippers and position the backrest trim cover up to access the backrest trim panel.

2. Remove the backrest trim panel.
  1. Remove the 2 screws located at the bottom of the backrest trim panel.
  2. Pull out at the bottom and slide the backrest trim panel up to disengage the 2 upper retaining hooks.

#### Non-police vehicles

3. Release the backrest trim cover J-clips.
  - Release the lower J-clip first and then release the 2 side J-clips.

#### All vehicles

4. Release the rear outboard cushion J-clips.

5. Release the cushion trim cover rear corner J-clip.

6. **NOTE:** The lumbar motor, bladder, hose and backing board are serviced as an assembly.

Detach the lumbar motor bracket clip.

7. Disconnect the electrical connector.

8. Detach the 2 lumbar support bracket clips (1 shown) and slide the lumbar assembly up to remove.

## Installation

### All vehicles

1. Slide the lumbar support bracket and lumbar assembly on the lumbar seat frame until seated on the 2 clips.

2. Connect the electrical connector.

3. Install the lumbar motor and attach the lumbar motor bracket clip.

4. Attach the cushion trim cover rear corner J-clip.

5. Attach the cushion trim cover rear J-clip.

### Non-police vehicles

6. **NOTE:** Note the alignment of the 2 side J-clips at the top of the seat to avoid bunching.

Attach the backrest trim cover J-clips.

- Attach the 2 side J-clips first and then attach the lower J-clip.

### Police vehicles

7. **NOTICE:** Inspect the seat backrest trim panel retaining hooks for damage. If damaged, install a new seat backrest trim panel.

Install the backrest trim panel.

## 2010 Crown Victoria, Grand Marquis Workshop Manual

1. Angle the top of the seat backrest trim panel inward and down to engage the 2 upper retaining hooks to the backrest frame.
2. Push in on the lower backrest trim panel and install the 2 screws.

8. Pull the seat backrest material down, zip both zippers and tuck the zippers under the material.

## **Lumbar Control Switch**

### **Removal and Installation**

**NOTE:** Driver side shown, passenger similar.

1. Remove the lumbar control switch.
    - Release the tabs and remove the power lumbar bezel.
    - Disconnect the electrical connector.
    - Remove the lumbar control switch.
  2. To install, reverse the removal procedure.
-

**Seat Control Switch**

**NOTE:** Driver side shown, passenger similar.

Item	Part Number	Description
1	14A701	Seat control switch
2	-	Electrical connector (part of 14A701)
3	23942 RH/ 23943 LH	Front door trim panel

**Removal and Installation**

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#) .
2. Remove the seat control switch.
  - Separate the electrical connector and wire harness from the door panel.
  - Release the locking tabs in the door panel and remove the front seat control switch.

3. To install, reverse the removal procedure.

**Heated Seat Switch**

**NOTE:** Driver side shown, passenger similar.

Item	Part Number	Description
1	-	Heated seat switch
2	-	Electrical connector
3	23942 RH/ 23943 LH	Front door trim panel

**Removal and Installation**

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#).
2. Remove the heated seat switch.
  1. Release the locking tabs.
  2. Disconnect the electrical connector.
  3. Remove the heated seat switch.

3. To install, reverse the removal procedure.

## Heated Seat Module

### Removal and Installation

1. Remove the affected seat. For additional information, refer to [Seat - Front](#) in this section.
2. Disconnect the electrical connector.

3. Remove the heated seat module.
  - Insert a flat-blade screwdriver into the heated seat module bracket and release the locking tab.
  - For installation, make sure the locking tab is correctly seated.

4. To install, reverse the removal procedure.
-

## Seat Track

### Removal and Installation

**NOTICE:** Use care when handling the seat and track assembly. Dropping the assembly or sitting on a seat not secured in the vehicle may result in damaged components.

1. Remove the seat. For additional information, refer to Seat - Front in this section.
2. Remove the safety belt buckle.
  - Remove the nut.
  - For driver seat, disconnect the safety belt buckle switch electrical connector.
  - For passenger seat, disconnect the safety belt buckle switch and Belt Tension Sensor (BTS) electrical connectors.
  - Remove the safety belt buckle.
  - To install, tighten to 48 Nm (35 lb-ft).
3. Release the cushion trim cover rear J-clip.

4. Release the cushion trim cover rear corner J-clip.
5. Release the J-clip.

6. Detach the electrical connector.

7. For driver seat, disconnect the seat position sensor electrical connector.
8. Remove the 2 recliner-to-seat track bolts.

- To install, tighten to 55 Nm (41 lb-ft).
9. Remove the pivot bolt.
- To install, tighten to 45 Nm (33 lb-ft).
10. Remove the seat track.
- Disconnect any remaining electrical connectors.
  - Remove the 4 seat track-to-cushion frame bolts and seat track.
    - ◆ To install, tighten to 20 Nm (177 lb-in).
11. **NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.

---

**Seat - Rear**

Item	Part Number	Description
1	-	Rear seat cushion
2	611B68 RH/ 611B69 LH	Safety belt retractor, outer (2 required)
3	N800937	Rear seat backrest nut (2 required)
4	-	Rear seat backrest

**Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B**. Failure to follow the instructions may result in serious personal injury.

For police vehicles equipped with a fire suppression system, depower the system.

2. Apply pressure to the lower front portion of the rear seat cushion. Push the rear seat cushion rearward to disengage the front retainers. Remove the rear seat cushion.
3. Remove the 2 rear seat backrest nuts, safety belt anchors and rear seat backrest.
  - To install, tighten to 55 Nm (41 lb-ft).

4. **⚠ WARNING:** The retaining wires in the rear seat cushion foam pad and frame, and rear seat backrest foam pad and frame must be fully seated in the retainer brackets to prevent the seat backrest and seat cushion from sliding forward in the event of a crash. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.

**NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.

5.  **WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

For police vehicles equipped with a fire suppression system, repower the system.

---

**Seat Armrest - Rear**

Item	Part Number	Description
1	-	Rear seat backrest (frame/pad/trim cover)
2	N621906	Armrest-to-backrest nut (4 required)
3	67210	Armrest bracket
4	13562	Rubber insert (2 required)
5	60108	Screw (2 required)
6	N800958	Hinge screw (2 required)
7	67273	Armrest trim cover
8	67244	Armrest

**Removal and Installation**

- ⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#). Failure to follow the instructions may result in serious personal injury.

For police vehicles equipped with a fire suppression system, depower the system.

- Remove the rear seat cushion and backrest. For additional information, refer to [Seat - Rear](#) in this section.
- Remove the 4 nuts.
  - To install, tighten to 5 Nm (44 lb-in).
- Remove the armrest.
- ⚠ WARNING:** The retaining wires in the rear seat cushion foam pad and frame, and rear seat backrest foam pad and frame must be fully seated in the retainer brackets to prevent the seat backrest and seat cushion from sliding forward in the event of a crash. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.

**NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.

6.  **WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

For police vehicles equipped with a fire suppression system, repower the system.

---

**Seat Backrest - Front****NOTE:** Driver seat shown, passenger similar.**NOTE:** Front 50 percent seat shown, 40 percent similar.

Item	Part Number	Description
1	611A08	Head restraint assembly
2	610A18	Head restraint guide (2 required)
3	60770	Seat back trim panel (police only)
4	-	Seat back trim panel screw (2 required, police only)
5	64416	Backrest trim cover
6	64810	Backrest foam pad
7	14D696	Backrest heater mat (if equipped)
8	-	Electrical connector (if equipped, part of 14D696)
9	62648/62649	Recliner assembly (power shown, if equipped)
10	N803463	Recliner-to-seat track bolt (2 required)
11	61198	Recliner handle
12	N803463	Recliner-to-backrest frame bolt (2 required)
13	-	Electrical connector (if equipped)
14	611D10	Side air bag module
15	N620480	Side air bag module nuts (2 required)
16	14716	Side air bag module wiring harness
17	N808123	Pivot bolt
18	65500	Lumbar assembly, power (if equipped)

19	-	Electrical connector (if equipped)
20	-	Lumbar support
21	61018	Backrest frame

**Disassembly**

**⚠ WARNING:** Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

**⚠ WARNING:** If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

**⚠ WARNING:** Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

**NOTE:** If a side air bag deployment took place the seat backrest foam pad, trim cover and side air bag module must be installed new. The backrest frame should be installed new if necessary.

**NOTE:** If a seat backrest heater mat is faulty, a new seat backrest foam pad must be installed with the heater mat. Do not reuse the original seat backrest foam pad.

**All vehicles**

1. Remove the front seat backrest. For additional information, refer to [Seat Backrest - Front](#) in this section.
2. If police vehicle, remove the head restraint locking clip (outboard side - driver, inboard side - passenger).

3. Press the release button and remove the head restraint.

4. **NOTE:** If installing a new side air bag module, use new retaining nuts. If the same side air bag module is to be reused, then reuse the side air bag module nuts.

Remove the 2 side air bag retaining nuts and discard (if required).

5. Position the side air bag module and deployment chute away from the mounting bracket and seat backrest frame.

6. Position the backrest trim cover and backrest foam pad forward enough to access the side air bag module.

7. Remove the side air bag module from the deployment chute.

- Pull the side air bag module mounting studs back through the deployment chute openings and remove the side air bag module from the deployment chute.

8. Disconnect the electrical connector and remove the side air bag module.

9. From inside the seat backrest, pinch the headrest guide pin ends and remove the sleeves.

10. Remove the backrest foam pad and trim cover.

- Separate the trim cover from the backrest foam pad.

### **Vehicles with power lumbar**

11. Detach the lumbar motor bracket clip.

12. Detach the 2 lumbar support bracket clips and slide the lumbar assembly up and off.

## Assembly

### Vehicles with power lumbar

1. Slide the lumbar support bracket and lumbar assembly onto the seat frame until seated on the 2 clips.

2. Install the lumbar motor and attach the lumbar motor bracket clip.

### All vehicles

3. Position the backrest trim cover to the backrest foam pad.
  1. With the backrest trim cover inside out, feed the side air bag module deployment chute through the backrest foam pad opening.
  2. Make sure the deflector flap is positioned as shown.

4. Position the backrest trim cover around the backrest foam pad and attach the hook-and-loop strips.
  - Make sure the side air bag deflector flap is positioned between the backrest trim cover and the backrest foam pad.
5. Align the backrest foam pad and trim cover to the backrest frame.
6. Install the head restraint sleeves.

7. If police vehicle, install the head restraint locking clip onto the head restraint sleeve.

8. Connect the side air bag module electrical connector.

9. **⚠ WARNING:** Before installing the seat side air bag module/deployment chute assembly:

- ◆ Inspect the side air bag module and mounting surfaces for any damage or foreign material.
- ◆ Remove any foreign material from the mounting surfaces of the deployment chute, the seat backrest frame mounting bracket and the air bag module cavity in the seat backrest foam pad.
- ◆ Install new parts if damaged.

Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

**⚠ WARNING:** Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

**⚠ WARNING:** If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

**⚠ WARNING:** Check the seat side air bag deployment chute for damage. The deployment chute must not be repaired. If there is any damage to the deployment chute, a new seat back trim cover and deployment chute must be installed as a unit. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

**⚠ WARNING:** If the seat side air bag module deployment chute is not correctly positioned and closed, the seat side air bag module may not deploy correctly. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

Position the side air bag module into the deployment chute.

- Position the side air bag module into the deployment chute with the alignment pin offset to

the top and the electrical connector to the bottom of the seat backrest. This will position the alignment pin correctly when the side air bag module and deployment chute are mounted to the backrest frame mounting bracket.

- The side air bag module mounting studs and alignment pin must come through the deployment chute stud openings.

10. Install the side air bag.

- Install the side air bag module onto the front seat backrest frame mounting bracket.
  - ♦ The deployment chute should not have any wrinkles or folds where it contacts the seat back frame mounting bracket.
- Install the 2 side air bag module nuts (new nuts, if required).
  - ♦ Tighten to 7 Nm (62 lb-in).

11. Reposition the backrest foam pad and trim cover to the backrest frame.

12. **NOTE:** The backrest frame and side air bag module have been removed from view for clarity.

Make sure the deflector flap lays flat between the backrest trim cover and backrest foam pad.

13. Install the head restraint.

14. Install the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

15. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

**Seat Cushion - Front****Driver Cushion**

**NOTE:** Driver seat shown. For disassembly and assembly of the passenger seat cushion, refer to Occupant Classification Sensor procedure in [Section 501-20B](#).

**NOTE:** Fifty percent seat shown, 40 percent similar.

Item	Part Number	Description
1	62900	Cushion trim cover
2	14D696	Cushion heater mat (if equipped)
3	-	Electrical connector (if equipped, part of 14D696)
4	632A22	Cushion foam pad
5	-	Pushpin
6	-	Mat
7	65478/644A18	Armrest pad/cover (if equipped)

10	672A28	Pin cover (2 required, if equipped)
11	W623464	Retaining clip (if equipped)
12	65476	Pin (if equipped)
13	63076	Armrest bracket (if equipped)
14	-	Nut, safety belt buckle

15	61202 RH/ 61203 LH	Safety belt buckle
16	-	Electrical connector
17	14C724	Heated seat module (if equipped)
18	-	Electrical connector
19	N808123	Pivot bolt
20	-	Bolt, seat position sensor (driver only)
21	-	Electrical connector (driver only)
22	-	Seat position sensor (driver only)
23	N803463	Recliner-to-backrest bolt (2 required)
24	N803463	Recliner-to-seat track bolt (2 required)
25	62648 RH/ 62649 LH	Recliner, power (if equipped)
26	-	Electrical connector (part of 14A699, if equipped)
27	61198	Recliner handle, manual
28	-	Lumbar control switch
29	-	Electrical connector
30	61704 RH/ 61705 LH	Manual seat track
31	61710	Power seat track
32	N802906	Seat track-to-cushion frame bolt (4 required)
33	14A699	Seat wiring harness
34	63100	Cushion frame
35	603A06	Cushion support spring (6 required)
36	63226	Seat cushion support

**Disassembly**

**NOTE:** If a driver seat cushion heater mat is faulty, a new seat cushion foam pad must be installed with the new heater mat. Do not reuse the original seat cushion foam pad.

**NOTE:** The heater mat on the front passenger seat cushion is not serviceable separately. If a new heater mat is needed on the front passenger seat cushion, a new Occupant Classification Sensor (OCS) system service kit and a new heater mat must be installed. Refer to Section 501-20B .

**Passenger seat**

1. Remove the OCS system components. For additional information, refer to Occupant Classification Sensor procedure in Section 501-20B .

**All seats**

2. Remove the seat. For additional information, refer to Seat - Front in this section.
3. Remove the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

4. Remove the seat track. For additional information, refer to [Seat Track](#) in this section.
5. If equipped, remove the power lumbar switch:
  - Release the tabs and remove the power lumbar bezel.
  - Disconnect the power lumbar switch electrical connector.
6. Release the retainers.
  1. Release the J-clip retainers.
  2. Remove the pin-type retainer.

7. If equipped, remove the seat armrest and bracket.
  - Remove the 2 covers, retaining clip and armrest pin.
  - Remove the armrest.
  - Remove the cover, 3 bolts and armrest bracket.

### Heated seats

8. Disconnect the cushion heater mat electrical connector.

9. Disconnect the heated seat module electrical connector.

10. Release the locking tab and remove the heated seat module.

### All seats

11. Remove the cushion frame.
12. If necessary, remove the 2 pushpins and the cushion mat. Otherwise, position the mat aside.
13. Remove the seat cushion trim cover from the foam pad.
14. Remove the cushion support.

## Assembly

### Passenger seat

1. Install the OCS system components. For additional information, refer to Occupant Classification Sensor procedure in Section 501-20B .

### All seats

2. Install the cushion support to the cushion frame.
3. Install the seat cushion trim cover to the foam pad.
4. Position the mat over the cushion support and install the 2 pushpins.
5. Install the frame.

### Heated seats

6. Slide the heated seat module onto the bracket until fully seated.

7. Connect the heated seat module electrical connector.

8. Connect the cushion heater mat electrical connector.

## All seats

9. Fasten the cushion trim cover retainers.

1. Fasten the J-clips.
2. Install the pin-type retainer.

10. If equipped with power lumbar:

- connect the power lumbar electrical connector.
- install the power lumbar switch bezel.

11. If equipped, install the seat armrest and bracket.

- Install the armrest bracket, 3 bolts and cover.
- Install the armrest.
- Install the armrest pin, retaining clip and covers.

12. Install the seat track. For additional information, refer to Seat Track in this section.

13. Install the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

14. Install the seat. For additional information, refer to Seat - Front in this section.

---

**Seat Armrest - Rear****NOTE:** Rear of backrest shown.

Item	Part Number	Description
1	-	Rear seat backrest
2	N621906	Armrest-to-backrest nut (4 required)
3	67210	Armrest bracket
4	13562	Rubber insert (2 required)
5	60108	Screw (2 required)
6	N800958	Hinge screw (2 required)
7	67273	Armrest trim cover
8	67244	Armrest

**Disassembly and Assembly**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B**. Failure to follow the instructions may result in serious personal injury.

For police vehicles equipped with a fire suppression system, depower the system.

2. Remove the armrest. For additional information, refer to **Seat Armrest - Rear** in this section.
3. Remove the rubber inserts from the armrest cup holder.
4. Remove the 2 screws from the armrest cup holder.
5. Remove the 2 pivot screws from the armrest.
6. Remove the hog rings.

7. Remove the armrest trim cover.
8. To assemble, reverse the disassembly procedure.
9. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

For police vehicles equipped with a fire suppression system, repower the system.

**Glass, Frames and Mechanisms**

The glass, frames and mechanisms consist of the:

- window control switches.
- window regulators.
- window regulator motors.
- door glass.
- door glass top runs.
- rear quarter glass.
- heated rear window.
- rear window defrost switch.
- rear window defrost relay.
- Driver Door Module (DDM)

The rear door glass top run contains the quarter glass and is removed as an assembly.

The power window system can be operated from the driver window control switch or from the window control switches located on each door panel. The driver window control switch has 2 modes of operation for the driver power window, manual and auto. All other windows operate in manual mode only.

Manual mode moves the window downward until the switch is released. Auto mode provides the one-touch down feature for the driver front power window. The one-touch down function allows the driver front power window to be completely lowered when the driver window control switch is pressed momentarily and then released. The one-touch down feature is controlled by the driver window control switch.

The power window system will only operate if:

- the ignition is in the RUN or ACC position.
- the accessory delay feature is in the active mode.

The heated rear window is controlled by the DDM . The ignition switch must be in RUN for the heated rear window to operate. When the rear window defrost switch is pressed, the DDM activates the rear window defrost relay which supplies voltage to the antenna module and the rear window defrost grid.

---

**Glass, Frames and Mechanisms**

## Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2574-A	Flex Probe Kit 105-R025B or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

**Principles of Operation****Power Window Control**

The driver power window one-touch down feature is controlled by the driver window control switch with integrated electronics. The one-touch down feature is requested by momentarily pressing the driver window down switch for 32 ms to 480 ms. The initial voltage input from the down switch starts the one-touch down operation. If the voltage input is less than 480 ms, the driver window control switch maintains the voltage supply to the window regulator motor down circuit. The Battery Junction Box (BJB) accessory delay relay supplies the voltage to the switch for one-touch down operation. The switch maintains the one-touch down operation until one of the following occur:

- Seven seconds expire
- The switch detects the motor is stalled by monitoring the current draw
- A voltage input is received by the switch on either the up or down switch circuits

There is only one ground for the switch and it is used for normal window operation and for one-touch down operation, making diagnostics simpler. If the ground is open, all window operations (one-touch and normal) are inoperative. The switch monitors the voltage on the down circuit for the driver window. If the switch continues to detect voltage on the down circuit for more than 480 ms after initial activation, the switch does not enable one-touch down operation. The down circuit through the switch is a direct connection to the motor in normal window operation mode. This allows the driver window switch to control the motor for normal operation.

The passenger window motors are hardwired directly to the window regulator control switches.

The window regulator motor has built-in circuit protection to prevent overheating due to excessive or repeated current draw.

If the window motor is cycled against significant resistance, the circuit protection function may be activated. This prevents operation of the window motor for several minutes.

Intermittent operation due to activation of the circuit protection is NOT a sign of window motor failure. Intermittent window operation is indicative of significant resistance to the movement of the glass or excessive duty cycle (repeated glass cycling). Significant resistance to window function may also be caused by extreme cold temperatures or build-up of frost or ice on the glass.

The glass cycle time from full down to full up should be less than 3.5 seconds at an ambient temperature of 22°C (72°F). Verification of glass cycle time MUST be conducted at or above this temperature.

## Rear Window Defrost

The rear window defrost is controlled by the Driver Door Module (DDM). The ignition switch must be in RUN for the rear window defrost to operate. Pressing the rear window defrost switch grounds the input to the DDM. If the module detects the ignition switch in RUN, ground is supplied to the rear window defrost relay output. The rear window defrost relay coil is energized which closes the contacts and supplies voltage to the antenna module. The antenna module then supplies voltage and ground to the rear window defrost grid.

## Inspection and Verification

**⚠ WARNING: If equipped with fire suppression system, refer to Section 100-02B for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.**

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

## Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Power window regulator</li> <li>• Window run weather-strip</li> <li>• Door window glass</li> </ul>	<ul style="list-style-type: none"> <li>• Battery Junction Box (BJB) fuse(s): <ul style="list-style-type: none"> <li>◆ 24 (10A)</li> <li>◆ 107 (40A)</li> </ul> </li> <li>• BJB circuit breaker 602 (20A)</li> <li>• Central Junction Box (CJB) fuse 9 (7.5A)</li> <li>• Driver Door Module (DDM)</li> <li>• Window control switch</li> <li>• Window regulator motor</li> <li>• Rear window defrost relay</li> <li>• Accessory delay relay</li> <li>• Rear window defrost switch</li> <li>• Rear window defrost grid</li> <li>• Antenna module</li> <li>• Loose, corroded connectors</li> </ul>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:

- verify the ignition key is in the ON position.
- verify the scan tool operation with a known good vehicle.
- refer to Section 418-00 to diagnose no response from the DDM .

7. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
- If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the DDM .

9. If the DTCs retrieved are related to the concern, go to Driver Door Module (DDM) DTC Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

## DTC Chart

### Driver Door Module (DDM) DTC Chart

DTC	Description	Action
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new Driver Door Module (DDM). REFER to <u>Section 419-10</u> .
B1345	Heated Backlite Input Circuit Short to Ground	<u>GO to Pinpoint Test G</u> .
B1349	Heated Backlite Relay Short to Battery	<u>GO to Pinpoint Test F</u> .
All Other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in <u>Section 419-10</u> .

## Symptom Chart

Symptom Chart

## Pinpoint Tests

### Pinpoint Test A: All the Power Windows are Inoperative

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

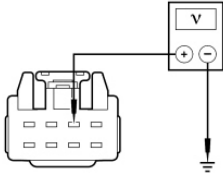

#### Normal Operation

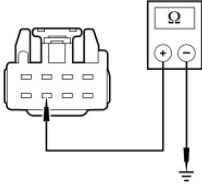

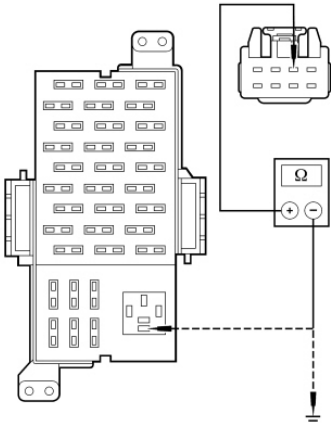

With the key in the ACC or RUN position the voltage is supplied to the coil side of the accessory delay relay through circuit 964 (DB/LG). When the accessory delay relay is energized, battery voltage is supplied to the driver window control switch on circuit 193 (YE/LG). The driver window control switch provides voltage and ground to all other window control switches. The driver window control switch is grounded through circuit 57 (BK).

#### This pinpoint test is intended to diagnose the following:

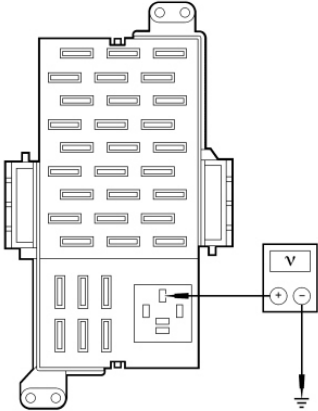

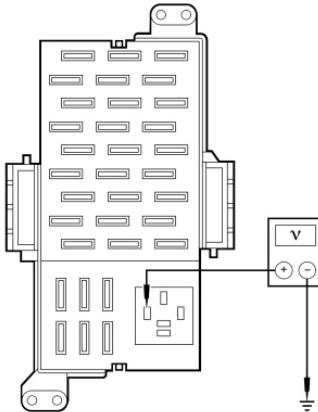

- Fuse(s)
- Circuit breaker
- Wiring, terminals or connectors
- Accessory delay relay
- Driver window control switch

#### PINPOINT TEST A: ALL THE POWER WINDOWS ARE INOPERATIVE

Test Step	Result / Action to Take
<b>A1 CHECK CIRCUIT 193 (YE/LG) FOR VOLTAGE</b>	
<ul style="list-style-type: none"> <li>• Disconnect: Driver Window Control Switch C504b.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between driver window control switch C504b-2, circuit 193 (YE/LG), harness side and ground.</li> </ul>  <p>N0088562</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	<p><b>Yes</b> GO to <u>A2</u> .</p> <p><b>No</b> GO to <u>A3</u> .</p>
<b>A2 CHECK CIRCUIT 57 (BK) FOR AN OPEN</b>	

<ul style="list-style-type: none"> <li>• Disconnect: Driver Window Control Switch C504a.</li> <li>• Measure the resistance between driver window control switch C504a-7, circuit 57 (BK), harness side and ground.</li> </ul>  <p>N0088563</p> <p>• Is the resistance less than 5 ohms?</p>	<p><b>Yes</b> INSTALL a new driver window control switch. REFER to <u>Window Control Switch</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>
<p><b>A3 CHECK CIRCUIT 193 (YE/LG) FOR AN OPEN OR A SHORT TO GROUND</b></p>	
<ul style="list-style-type: none"> <li>• Disconnect: Accessory Delay Relay.</li> <li>• Measure the resistance between driver window control switch C504b-2, circuit 193 (YE/LG), harness side and the accessory delay relay pin 87, circuit 193 (YE/LG), harness side; and between driver window control switch C504b-2, circuit 193 (YE/LG), harness side and ground.</li> </ul>  <p>N0093780</p> <p>• Is the resistance less than 5 ohms between the driver window control switch and the accessory relay; and greater than 10,000 ohms between the driver window control switch and ground?</p>	<p><b>Yes</b> GO to <u>A4</u> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>
<p><b>A4 CHECK CIRCUIT 768 (BN/YE) FOR VOLTAGE</b></p>	

<ul style="list-style-type: none"> <li>• Measure the voltage between accessory delay relay pin 30, circuit 768 (BN/YE), harness side and ground.</li> </ul>  <p>N0052509</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	<p><b>Yes</b> GO to <u>A5</u> .</p> <p><b>No</b> VERIFY the Battery Junction Box (BJB) circuit breaker 602 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to Wiring Diagrams Manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation.</p>
<b>A5 CHECK CIRCUIT 964 (DB/LG) FOR VOLTAGE</b>	
<ul style="list-style-type: none"> <li>• Measure the voltage between accessory delay relay pin 86, circuit 964 (DB/LG), harness side and ground.</li> </ul>  <p>N0070848</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	<p><b>Yes</b> GO to <u>A6</u> .</p> <p><b>No</b> VERIFY the Central Junction Box (CJB) fuse 9 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to Wiring Diagrams Manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation.</p>
<b>A6 CHECK THE ACCESSORY DELAY RELAY CIRCUIT 57 (BK) FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Measure the resistance between accessory delay relay pin 85, circuit 57 (BK), harness side and ground.</li> </ul>	<p><b>Yes</b> INSTALL a new accessory delay relay. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

- Is the resistance less than 5 ohms?

### Pinpoint Test B: A Single Power Window is Inoperative - Driver

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

#### Normal Operation

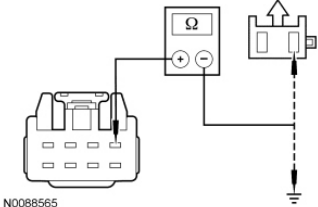

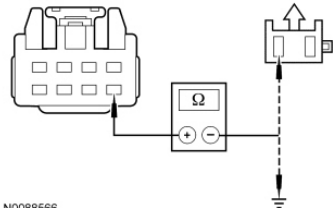

When the driver window is operated in the down direction, voltage is supplied to the driver window motor from the driver window control switch on circuit 227 (YE) and ground is supplied on through circuit 226 (WH/BK). When the driver window is operated in the up direction, voltage is supplied on circuit 226 (WH/BK) and ground through circuit 227 (YE).

#### This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver window control switch
- Driver window motor

### PINPOINT TEST B: A SINGLE POWER WINDOW IS INOPERATIVE - DRIVER

Test Step	Result / Action to Take
<b>B1 CHECK FOR A SHORTED DRIVER WINDOW CONTROL SWITCH</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Driver Window Control Switch C504a, C504b.</li> <li>• Carry out the driver window control switch component test.</li> </ul> <p>Refer to Wiring Diagrams Cell <u>149</u> for component testing.</p> <ul style="list-style-type: none"> <li>• <b>Does the driver window control switch pass the component test?</b></li> </ul>	<p><b>Yes</b> GO to <u>B2</u> .</p> <p><b>No</b> INSTALL a new driver window control switch. REFER to <u>Window Control Switch</u> in this section. TEST the system for normal operation.</p>
<b>B2 CHECK CIRCUIT 227 (YE) FOR AN OPEN OR SHORT TO GROUND</b>	

<ul style="list-style-type: none"> <li>• Disconnect: Driver Window Motor C524.</li> <li>• Measure the resistance between driver window control switch C504b-1, circuit 227 (YE), harness side and driver window motor C524-2, circuit 227 (YE), harness side; and between driver window control switch C504b-1, circuit 227 (YE), harness side and ground.</li> </ul>  <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms between the switch and motor; and greater than 10,000 ohms between the switch and ground?</li> </ul>	<p><b>Yes</b> GO to <b>B3</b> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>
<p><b>B3 CHECK CIRCUIT 226 (WH/BK) FOR AN OPEN OR SHORT TO GROUND</b></p>	
<ul style="list-style-type: none"> <li>• Measure the resistance between driver window control switch C504b-5, circuit 226 (WH/BK), harness side and driver window motor C524-1, circuit 226 (WH/BK), harness side; and between driver window control switch C504b-5, circuit 226 (WH/BK), harness side and ground.</li> </ul>  <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms between the switch and motor; and greater than 10,000 ohms between the switch and ground?</li> </ul>	<p><b>Yes</b> INSTALL a new driver window regulator motor. REFER to <u>Window Regulator Motor - Front Door</u> in this section.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

### Pinpoint Test C: A Single Power Window is Inoperative - Passenger Front

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

#### Normal Operation

Voltage is supplied to the passenger front window control switch from the driver window control switch through circuit 170 (RD/LB). If the driver window control switch is in the LOCK position, the circuit is open and the window does not operate from the passenger front window control switch.

When operating the passenger front window in the down direction, ground is provided from the driver window control switch through circuit 313 (WH/YE). Voltage is supplied to the passenger front window motor through circuit 333 (YE/RD) and ground through circuit 334 (RD/YE).

When operating the passenger front window in the up direction, ground is received from the driver window control switch through circuit 314 (TN/LB). Voltage is supplied to the passenger front window motor through circuit 334 (RD/YE) and ground through circuit 333 (YE/RD).

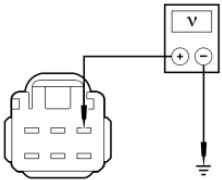

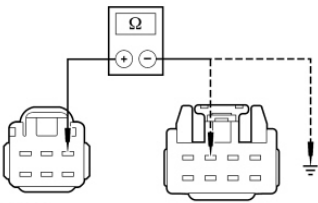

When the passenger front window is operated in the down direction from the driver window control switch, voltage is sent to the passenger front window control switch through circuit 314 (TN/LB), which transfers voltage to the passenger front window motor through circuit 333 (YE/RD). Ground is provided to the RH front window switch through circuit 313 (WH/YE), which transfers ground to the passenger front window motor through circuit 334 (RD/YE). When the passenger front window is operated in the up direction from the driver window control switch, voltage is sent to the passenger front window control switch through circuit 313 (WH/YE), which transfers voltage to the passenger front window motor through circuit 334 (RD/YE). Ground is provided to the passenger front window switch through circuit 314 (TN/LB), which transfers ground to the passenger front window motor through circuit 333 (YE/RD).

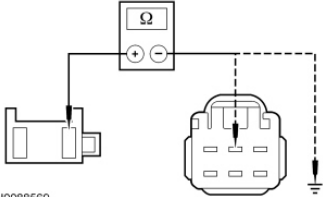

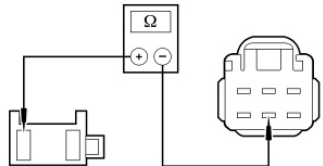

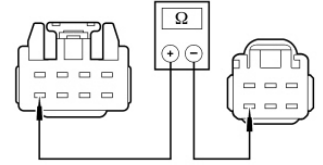

**This pinpoint test is intended to diagnose the following:**

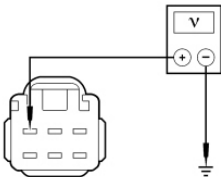

- Wiring, terminals or connectors
- Passenger window motor
- Passenger front window control switch
- Driver window control switch

**PINPOINT TEST C: A SINGLE POWER WINDOW IS INOPERATIVE - PASSENGER FRONT**

Test Step	Result / Action to Take
<b>C1 CHECK THE OPERATION FROM THE DRIVER WINDOW CONTROL SWITCH</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Operate the front passenger window from the driver window control switch.</li> <li>• <b>Does the front passenger window operate from the driver window control switch?</b></li> </ul>	<p><b>Yes</b> VERIFY the window lock button is off. If the button is off, GO to <u>C10</u> .</p> <p><b>No</b> GO to <u>C2</u> .</p>
<b>C2 CHECK THE DOWN INPUT TO THE WINDOW MOTOR</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Front Passenger Window Motor C608.</li> <li>• Ignition ON.</li> <li>• While pressing the driver window control switch to the front passenger down position, measure the voltage between front passenger window motor C608-2, circuit 333 (YE/RD), harness side and ground.</li> </ul> <div data-bbox="308 1832 635 2018"> <p>N0013028</p> </div> <ul style="list-style-type: none"> <li>• <b>Is the voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <u>C6</u> .</p> <p><b>No</b> GO to <u>C3</u> .</p>

### Pinpoint Test D: A Single Power Window is Inoperative - Passenger Rear

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

#### Normal Operation

Voltage is supplied to the left rear and right rear power windows from the driver window control switch through circuit 170 (RD/LB). If the driver window control switch is in the LOCK position, the circuit is open and the windows do not operate from their respective window control switches.

**NOTE:** Police vehicles have additional rear window disable in line connector between the driver window control switch and the RH and LH rear window control switches on circuit 170 (RD/LB). Make sure the window(s) are in the operational position when making measurements.

**LH Rear**

When operating the LH rear window in the down direction, ground is provided from the driver window control switch through circuit 317 (GY/OG). Voltage is supplied to the LH rear window motor through circuit 334 (RD/YE) and ground through circuit 333 (YE/RD).

When operating the LH rear window in the up direction, ground is provided from the driver window control switch through circuit 316 (YE/LB). Voltage is supplied to the LH rear window motor through circuit 333 (YE/RD) and ground through circuit 334 (RD/YE).

When the LH rear power window is operated in the down direction from the driver window control switch, voltage is sent to LH rear window control switch through circuit 316 (YE/LB), which transfers power to the LH rear window motor through circuit 334 (RD/YE). Ground is provided to the LH rear window control switch through circuit 317 (GY/OG), which transfers ground to the LH rear window motor through circuit 333 (YE/RD). When the LH rear window is operated in the up direction from the driver window control switch, voltage is sent to the LH rear window control switch through circuit 317 (GY/OG), which transfers power to the LH rear window motor through circuit 333 (YE/RD). Ground is provided to the LH rear window switch through circuit 316 (YE/LB), which transfers ground to the LH rear window motor through circuit 334 (RD/YE).

**RH Rear**

When operating the RH rear window in the down direction, ground is provided from the driver window control switch through circuit 319 (YE/BK). Voltage is supplied to the right rear window motor through circuit 334 (RD/YE) and ground through circuit 333 (YE/RD).

When operating the right rear window in the up direction, ground is provided from the driver window control switch through circuit 320 (RD/BK). Voltage is supplied to the right rear window motor through circuit 333 (YE/RD) and ground through circuit 334 (RD/YE).

When the right rear power window is operated in the down direction from the driver window control switch, voltage is sent to right rear window control switch through circuit 320 (RD/BK), which transfers power to the right rear window motor through circuit 334 (RD/YE). Ground is provided to the right rear window control switch through circuit 319 (YE/BK), which transfers ground to the right rear window motor through circuit 333 (YE/RD). When the right rear window is operated in the up direction from the driver window control switch, voltage is sent to the right rear window control switch through circuit 319 (YE/BK), which transfers power to the right rear window motor through circuit 333 (YE/RD). Ground is provided to the right rear window switch through circuit 320 (RD/BK), which transfers ground to the right rear window motor through circuit 334 (RD/YE).

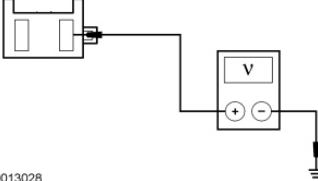

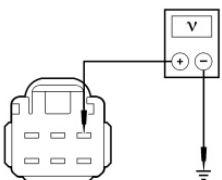

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- LH rear passenger window control switch
- RH rear passenger window control switch
- Driver window control switch
- LH rear window regulator motor
- RH rear window regulator motor

**PINPOINT TEST D: A SINGLE POWER WINDOW IS INOPERATIVE - PASSENGER REAR**

Test Step	Result / Action to Take
<b>D1 CHECK THE OPERATION FROM THE DRIVER WINDOW CONTROL SWITCH</b>	

<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Operate the rear passenger windows from the driver window control switch.</li> <li>• <b>Do the rear passenger windows operate from the driver window control switch?</b></li> </ul>	<p><b>Yes</b> VERIFY the window lock button is OFF. If the button is OFF, GO to <u>D6</u>.</p> <p><b>No</b> GO to <u>D2</u>.</p>
<p><b>D2 CHECK THE DOWN INPUT TO THE REAR PASSENGER WINDOW MOTOR</b></p>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Rear Window Motor C703 (LH), C803 (RH).</li> <li>• Ignition ON.</li> <li>• While pressing the driver window control switch to the inoperative rear window in the down position, measure the voltage between LH rear passenger window motor C703-2 or RH rear passenger window motor C803-2, circuit 333 (YE/RD), harness side and ground.</li> </ul>  <p>N0013028</p> <ul style="list-style-type: none"> <li>• <b>Is the voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <u>D7</u>.</p> <p><b>No</b> GO to <u>D3</u>.</p>
<p><b>D3 CHECK THE DOWN INPUT TO THE REAR WINDOW CONTROL SWITCH</b></p>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Rear Window Control Switch C701 (LH), C801 (RH).</li> <li>• Ignition ON.</li> <li>• While pressing the driver window control switch to the inoperative rear window in the down position, measure the voltage between LH rear passenger window control switch C701-1, circuit 316 (YE/LB) or RH rear passenger window control switch C801-1, circuit 320 (RD/BK), harness side and ground.</li> </ul>  <p>N0088572</p> <ul style="list-style-type: none"> <li>• <b>Is the voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <u>D5</u>.</p> <p><b>No</b> GO to <u>D4</u>.</p>
<p><b>D4 CHECK CIRCUITS 316 (YE/LB) AND 320 (RD/BK) FOR AN OPEN OR SHORT TO GROUND</b></p>	

- Ignition OFF.
- Disconnect: Driver Window Control Switch C504a.
- Measure the resistance between the inoperative rear window control switch, harness side and the driver window control switch, harness side; and between the inoperative rear window control switch, harness side and ground as follows:

Rear Passenger Door Control Switch Connector - Pin	Circuit	Driver Door Window Control Switch Connector - Pin	Circuit
C701-1 (LH)	316 (YE/LB)	C504a-1	316 (YE/LB)
C801-1 (RH)	320 (RD/BK)	C504a-4	320 (RD/BK)

- Is the resistance less than 5 ohms between the switches; and greater than 10,000 ohms between the switch and ground?

**Yes**

INSTALL a new driver window control switch. TEST the system for normal operation.

**No**

REPAIR the circuit in question. TEST the system for normal operation.

#### D5 CHECK CIRCUIT 334 (RD/YE) FOR AN OPEN OR SHORT TO GROUND

- Measure the resistance between inoperative rear window control switch (LH) C701-2, (RH) C801-2, circuit 334 (RD/YE), harness side and inoperative rear window motor (LH) C703-1, (RH) C803-1, circuit 334 (RD/YE), harness side.

- Is the resistance less than 5 ohms?

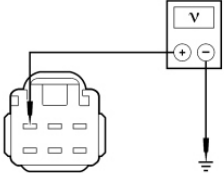

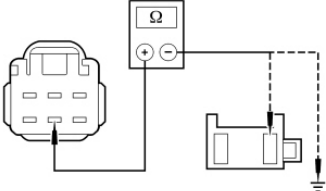

**Yes**

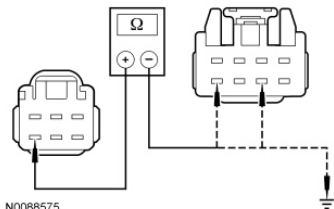

INSTALL a new rear window control switch. TEST the system for normal operation.

**No**

REPAIR the circuit. TEST the system for normal operation.

#### D6 CHECK CIRCUIT 170 (RD/LB) FOR AN OPEN

<p><b>NOTE:</b> Police vehicles have additional rear window disable in line connector between the driver window control switch and the RH and LH rear window control switches on circuit 170 (RD/LB). Make sure the window(s) are in the operational position when making measurements.</p> <ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Inoperative Rear Window Control Switch (LH) C701, (RH) C801.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between inoperative rear window control switch (LH) C701-3, (RH) C801-3, circuit 170 (RD/LB), harness side and ground.</li> </ul>  <p>N0076965</p> <p>• Is the voltage greater than 10 volts?</p>	<p><b>Yes</b> INSTALL a new rear window control switch. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>
<b>D7 CHECK CIRCUIT 333 (YE/RD) FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Inoperative Rear Window Control Switch (LH) C701, (RH) C801.</li> <li>• Measure the resistance between inoperative rear window control switch (LH) C701-5, (RH) C801-5, circuit 333 (YE/RD), harness side and inoperative rear window motor (LH) C703-2, (RH) C803-2, circuit 333 (YE/RD), harness side; and between inoperative rear window control switch (LH) C701-5, (RH) C801-5, circuit 333 (YE/RD), harness side and ground.</li> </ul>  <p>N0088625</p> <p>• Is the resistance less than 5 ohms between the inoperative switch and motor; and greater than 10,000 ohms between the inoperative switch and ground?</p>	<p><b>Yes</b> GO to <u>D8</u> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

<ul style="list-style-type: none"><li>• Carry out the inoperative rear window control switch and the driver window control switch component tests.</li></ul> <p>Refer to Wiring Diagrams Cell <u>149</u> for component testing.</p> <ul style="list-style-type: none"><li>• Do the inoperative rear window control switch and driver window control switch pass the component test?</li></ul>		<b>Yes</b> INSTALL a new rear window motor. REFER to <u>Window Regulator Motor - Rear Door</u> in this section. TEST the system for normal operation.													
		<b>No</b> INSTALL a new window control switch as necessary. TEST the system for normal operation.													

### Pinpoint Test E: The Defrost System is Inoperative

Refer to Wiring Diagrams Cell **56** , Heated Windows for schematic and connector information.

**Normal Operation**

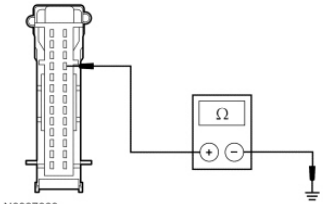

The rear window defrost system is controlled by the Driver Door Module (DDM). The ignition switch must be in RUN for the DDM to operate. When the rear window defrost switch is pressed, the DDM provides a ground for the rear window defrost relay coil through circuit 688 (GY/LB). The rear window defrost relay coil is energized, providing battery voltage to the antenna module on circuit 186 (BN/LB). The antenna module then supplies voltage and ground to the rear window defrost grid.

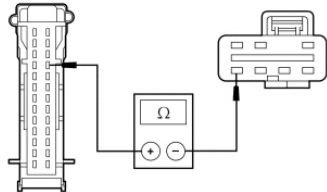

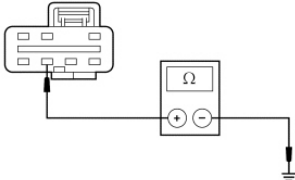

**This pinpoint test is intended to diagnose the following:**

- Fuse
- Wiring, terminals or connectors
- Rear window defrost relay
- Rear window defrost switch
- Rear window defrost grid
- Antenna module
- DDM

**PINPOINT TEST E: THE DEFROST SYSTEM IS INOPERATIVE**

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>E1 CHECK THE REAR WINDOW DEFROST SWITCH CIRCUIT FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: DDM C501a.</li> <li>• While pressing the rear window defrost switch, measure resistance between DDM C501a-23, circuit 1010 (DB/OG), harness side and ground.</li> </ul>  <p style="text-align: center;">N0027063</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms with the rear window defrost switch pressed?</li> </ul>	<p><b>Yes</b> CONNECT the DDM C501a. GO to <u>E4</u> .</p> <p><b>No</b> GO to <u>E2</u> .</p>
<b>E2 CHECK CIRCUIT 1010 (DB/OG) FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Disconnect: Rear Window Defrost Switch C241.</li> <li>• Measure the resistance between DDM C501a-23, circuit 1010 (DB/OG), harness side, and rear window defrost switch C241-1, circuit 1010 (DB/OG), harness side.</li> </ul>	<p><b>Yes</b> GO to <u>E3</u> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

 <p>N0027064</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	
<b>E3 CHECK CIRCUIT 57 (BK) FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Measure the resistance between rear window defrost switch C241-2, circuit 57 (BK), harness side and ground.</li> </ul>  <p>A0028365</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p><b>Yes</b> INSTALL a new rear window defrost switch. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>
<b>E4 CHECK THE SIGNAL INPUT</b>	
<p><b>NOTICE:</b> Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use the test lamp probe.</p> <ul style="list-style-type: none"> <li>• Disconnect: Rear Window Defrost Relay.</li> <li>• Start the engine.</li> <li>• Press the rear window defrost switch to ON.</li> <li>• Connect a 12-volt incandescent test lamp between rear window defrost relay socket pin 85, circuit 688 (GY/LB) and rear window defrost relay socket pin 86, circuit 185 (BK).</li> </ul>	<p><b>Yes</b> GO to <u>E6</u> .</p> <p><b>No</b> GO to <u>E5</u> .</p>

- Does the test lamp illuminate?

#### E5 CHECK CIRCUIT 688 (GY/LB) FOR AN OPEN

- Ignition OFF.
- Disconnect: DDM 501b.
- Measure the resistance between rear window defrost relay pin 85, circuit 688 (GY/LB), harness side and the DDM C501b-15, circuit 688 (GY/LB), harness side.

- Is the resistance less than 5 ohms?

**Yes**  
GO to E12 .

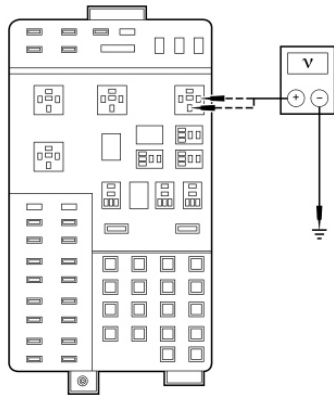

**No**  
REPAIR the circuit. TEST the system for normal operation.

#### E6 CHECK CIRCUIT 185 (BK) FOR VOLTAGE

- Measure the voltage between rear window defrost relay pin 30, circuit 185 (BK), harness side and ground; and between rear window defrost relay pin 86, circuit 185 (BK), harness side and ground.

**Yes**  
GO to E7 .

**No**  
VERIFY the Battery Junction Box (BJB) fuse 107 (40A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to Wiring Diagrams Manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation.

N0070851

- Is the voltage greater than 10 volts?

#### E7 CHECK THE REAR WINDOW DEFROST RELAY FOR CORRECT OPERATION

- Carry out the ISO relay component test for the rear window defrost relay.

Refer to Wiring Diagrams Cell 149 for component testing.

- Is the rear window defrost relay OK?

**Yes**  
GO to E8 .

**No**  
INSTALL a new rear window defrost relay. TEST the system for normal operation.

#### E8 CHECK THE RELAY OUTPUT TO THE HEATED REAR WINDOW GRID

- Ignition OFF.
- Connect: Rear Window Defrost Relay.
- Disconnect: Rear Window Defrost Grid Connector.
- Start the engine.
- Press the rear window defrost switch to on.
- Measure the voltage between rear window defrost grid connector, harness side and ground.

AN1273-A

- Is the voltage greater than 10 volts?

**Yes**  
GO to E11 .

**No**  
GO to E9 .

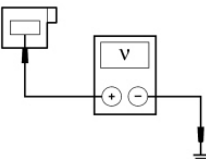

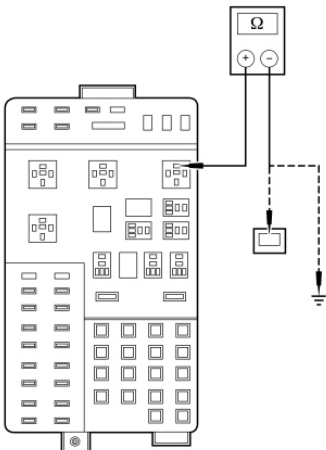

#### E9 CHECK THE RELAY OUTPUT TO THE ANTENNA MODULE

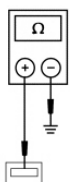

- Ignition OFF.
- Disconnect: Antenna Module C402A.
- Start the engine.
- Press the rear window defrost switch to on.
- Measure the voltage between antenna module C402A-1, circuit 186 (BN/LB), harness side and

**Yes**  
INSTALL a new antenna module. REFER to Section 415-00 . TEST the system for normal operation.

**No**  
GO to E10 .

<p>ground.</p>  <p>A0079579</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	
<b>E10 CHECK CIRCUIT 186 (BN/LB) FOR AN OPEN OR SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: BJB Fuse 24 (10A).</li> <li>• Disconnect: Rear Window Defrost Relay.</li> <li>• Measure the resistance between antenna module C402A-1, circuit 186 (BN/LB), harness side and pin 87, circuit 186 (BN/LB), harness side; and between antenna module C402A-1, circuit 186 (BN/LB), harness side and ground.</li> </ul>  <p>N0070852</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms between the antenna module and the rear window defrost relay; and greater than 10,000 ohms between the antenna module and ground?</li> </ul>	<p><b>Yes</b> INSTALL a new rear window defrost relay. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>
<b>E11 CHECK THE GROUND FOR THE HEATED REAR WINDOW GRID</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Rear Window Defrost Grid Ground Connector.</li> <li>• Measure the resistance between rear window defrost grid ground connector, circuit 57 (BK), harness side and ground.</li> </ul>	<p><b>Yes</b> CARRY OUT the Grid Wire Test in this section. REPAIR the rear window defrost grid. REFER to <u>Window Grid Wire Repair</u> in this section. TEST the system for normal operation.</p> <p><b>No</b></p>

 <p>AN1274-A</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p>INSTALL a new antenna module. REFER to <u>Section 415-00</u> . TEST the system for normal operation.</p>
<b>E12 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>♦ corrosion.</li> <li>♦ pushed-out pins.</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

**Pinpoint Test F: DTC B1349 - Heated Backlite Relay Short to Battery**

Refer to Wiring Diagrams Cell 56 , Heated Windows for schematic and connector information.

**Normal Operation**

The key must be in the START or RUN position for the rear window defrost to operate. When the rear window defrost switch is pressed, a momentary ground is supplied to the Driver Door Module (DDM) through circuit 1010 (DB/OG). The DDM provides a ground for the rear window defrost relay coil on circuit 688 (GY/LB). When the rear window defrost relay coil is energized, the relay switch closes, providing voltage to the rear window defrost grid, the rear window defrost indicator, and the heated exterior mirror (if equipped) through circuit 186 (BN/LB). The rear window defrost grid and the rear window defrost switch are grounded through circuit 57 (BK).

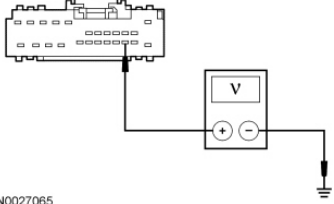

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Rear window defrost relay
- DDM

**PINPOINT TEST F: DTC B1349 - HEATED BACKLIGHT RELAY SHORT TO BATTERY**

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>F1 CHECK CIRCUIT 688 (GY/LB) FOR SHORT TO VOLTAGE</b>	

<ul style="list-style-type: none"> <li>• Disconnect: DDM C501b.</li> <li>• Disconnect: Rear Window Defrost Relay.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between DDM C501b-15, circuit 688 (GY/LB), harness side and ground.</li> </ul>  <p>N0027065</p> <ul style="list-style-type: none"> <li>• Is there any voltage indicated?</li> </ul>	<p><b>Yes</b> REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.</p> <p><b>No</b> GO to <u>F2</u> .</p>
<b>F2 CHECK THE REAR WINDOW DEFROST RELAY FOR CORRECT OPERATION</b>	
<ul style="list-style-type: none"> <li>• Carry out the ISO relay component test for the rear window defrost relay.</li> </ul> <p>Refer to Wiring Diagrams Cell <u>149</u> for component testing.</p> <ul style="list-style-type: none"> <li>• Is the rear window defrost relay OK?</li> </ul>	<p><b>Yes</b> GO to <u>F3</u> .</p> <p><b>No</b> INSTALL a new rear window defrost relay. CLEAR the DTCs. REPEAT the self-test.</p>
<b>F3 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion.</li> <li>◆ pushed-out pins.</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.</p>

### Pinpoint Test G: The Defrost System Does Not Shut Off Automatically

Refer to Wiring Diagrams Cell 56 , Heated Windows for schematic and connector information.

#### Normal Operation

The key must be in the START or RUN position for the rear window defrost system to operate. When the rear window defrost switch is pressed, a momentary ground is supplied to the Driver Door Module (DDM) through circuit 1010 (DB/OG). The DDM provides a ground for the rear window defrost relay coil on circuit 688 (GY/LB). When the rear window defrost relay coil is energized, the relay switch closes, providing voltage to the rear window defrost grid, the rear window defrost indicator, and the heated exterior mirror (if equipped) through circuit 186 (BN/LB). The rear window defrost grid and the rear window defrost switch are grounded

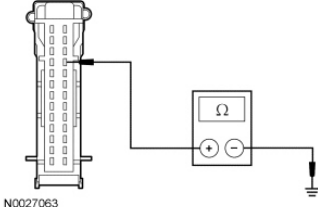

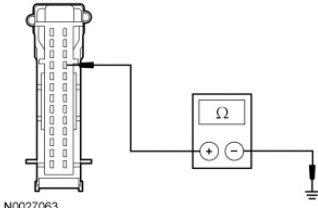

through circuit 57 (BK).

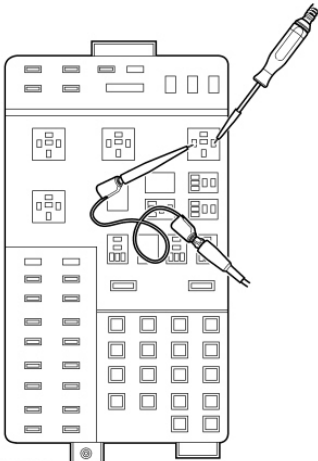

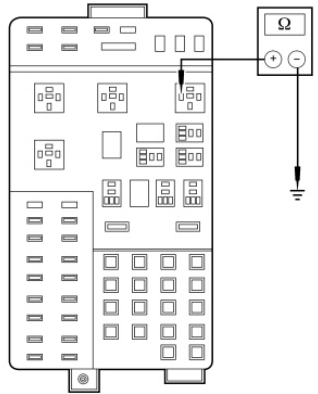

**This pinpoint test is intended to diagnose the following:**

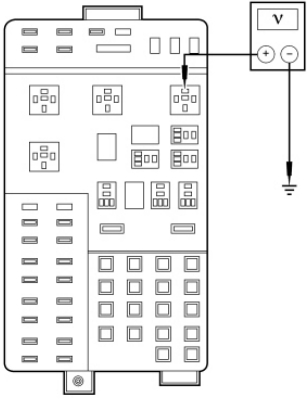

- Wiring, terminals or connectors
- Rear window defrost switch
- Rear window defrost relay
- DDM

**PINPOINT TEST G: THE DEFROST SYSTEM DOES NOT SHUT OFF AUTOMATICALLY**

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>G1 CHECK THE REAR WINDOW DEFROST SWITCH CIRCUIT FOR A SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: DDM C501a.</li> <li>• Measure the resistance between DDM C501a-23, circuit 1010 (DB/OG), harness side and ground.</li> </ul>  <p><b>• Is the resistance greater than 10,000 ohms?</b></p>	<p><b>Yes</b> GO to <u>G3</u> .</p> <p><b>No</b> GO to <u>G2</u> .</p>
<b>G2 CHECK HEATED CIRCUIT 1010 (DB/OG) FOR A SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>• Disconnect: Rear Window Defrost Switch C241.</li> <li>• Measure the resistance between DDM C501a-23, circuit 1010 (DB/OG), harness side and ground.</li> </ul>  <p><b>• Is the resistance greater than 10,000 ohms?</b></p>	<p><b>Yes</b> INSTALL a new rear window defrost switch. TEST the system for normal operation.</p>
<p><b>G5 CHECK CIRCUIT 186 (BN/LB) FOR A SHORT TO VOLTAGE</b></p>	

<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Measure the voltage between rear window defrost relay pin 87, circuit 186 (BN/LB), harness side and ground.</li> </ul>  <p>N0070853</p> <ul style="list-style-type: none"> <li>• Is any voltage present?</li> </ul>	<p><b>Yes</b> REPAIR the circuit. TEST the system for normal operation.</p> <p><b>No</b> GO to <u>G6</u> .</p>
<b>G6 CHECK THE REAR WINDOW DEFROST RELAY FOR CORRECT OPERATION</b>	
<ul style="list-style-type: none"> <li>• Carry out the ISO relay component test for the rear window defrost relay.</li> </ul> <p>Refer to Wiring Diagrams Cell <u>149</u> for component testing.</p> <ul style="list-style-type: none"> <li>• Is the rear window defrost relay OK?</li> </ul>	<p><b>Yes</b> GO to <u>G7</u> .</p> <p><b>No</b> INSTALL a new rear window defrost relay. TEST the system for normal operation.</p>
<b>G7 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>♦ corrosion.</li> <li>♦ pushed-out pins.</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

### Pinpoint Test H: The Defrost System is Inoperative - ON Indicator

Refer to Wiring Diagrams Cell 56 , Heated Windows for schematic and connector information.

#### Normal Operation

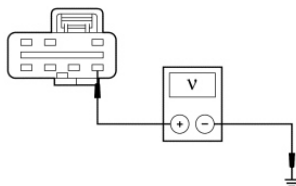

When the rear window defrost relay is energized, switched voltage is supplied to the rear window defrost switch indicator through circuit 59 (DG/VT). The switch is grounded through circuit 57 (BK).

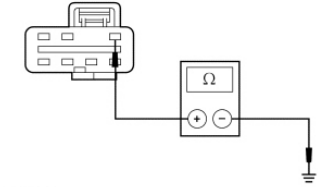

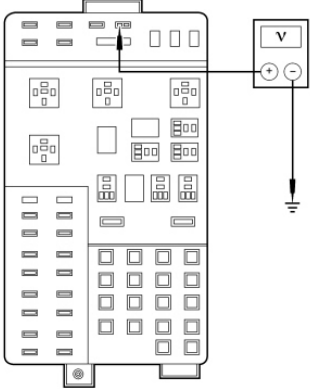

**This pinpoint test is intended to diagnose the following:**

- Fuse

- Wiring, terminals or connectors
- Rear window defrost switch

**PINPOINT TEST H: THE DEFROST SYSTEM IS INOPERATIVE - ON INDICATOR**

Test Step	Result / Action to Take
<b>H1 CHECK THE HEATED REAR WINDOW OPERATION</b>	
<ul style="list-style-type: none"> <li>• Start the engine.</li> <li>• Press the rear window defrost switch to ON.</li> <li>• <b>Does the rear window defrost grid operate?</b></li> </ul>	<p><b>Yes</b> GO to <u>H2</u> .</p> <p><b>No</b> <u>GO to Pinpoint Test E</u> .</p>
<b>H2 CHECK THE VOLTAGE TO THE REAR WINDOW DEFROST SWITCH INDICATOR</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Rear Window Defrost Switch C241.</li> <li>• Start the engine.</li> <li>• Enter the following diagnostic mode on the scan tool: DDM DataLogger.</li> <li>• Trigger the DDM PID HEAT_BCK ON.</li> <li>• Measure the voltage between rear window defrost switch C241-4, circuit 59 (DG/VT), harness side and ground.</li> </ul>  <p>A0028367</p> <ul style="list-style-type: none"> <li>• <b>Is the voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <u>H3</u> .</p> <p><b>No</b> VERIFY the BJB fuse 24 (10A) is OK. If OK, GO to <u>H4</u> . If not OK, REFER to Wiring Diagrams Manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation.</p>
<b>H3 CHECK CIRCUIT 57 (BK) FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Measure the resistance between rear window defrost switch C241-7, circuit 57 (BK), harness side and ground.</li> </ul>	<p><b>Yes</b> INSTALL a new rear window defrost switch. TEST the system for normal operation.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

 <p>N0027069</p> <p>• Is the resistance less than 5 ohms?</p>	
<p><b>H4 CHECK CIRCUIT 186 (BN/LB) FOR AN OPEN</b></p>	
<ul style="list-style-type: none"> <li>• Disconnect: BJB Fuse 24 (10A).</li> <li>• Measure the voltage between input cavity of BJB fuse 24 (10A), circuit 186 (BN/LB) and ground.</li> </ul>  <p>N0070854</p> <p>• Is the voltage greater than 10 volts?</p>	<p><b>Yes</b> REPAIR circuit 59 (DG/VT). TEST the system for normal operation.</p> <p><b>No</b> REPAIR circuit 186 (BN/LB). TEST the system for normal operation.</p>

## Component Tests

### Grid Wire Test

1. Using a bright lamp in the vehicle, inspect the wire grid from the exterior. A broken grid wire appears as a brown spot.
2. Run the engine at idle. Set the heated rear window switch to ON. The indicator light should come on.
3. Working in the vehicle with a voltmeter, contact the broad red-brown stripes of the rear glass window positive lead to battery side and the negative lead to ground side. The meter should read 10-13 volts. A lower voltage reading indicates a loose ground connection.
4. Contact a good ground point with the negative lead of the meter. The voltage reading should not change.
5. With the negative lead of the meter grounded, touch each grid line of the heated rear window glass at its midpoint with the positive lead. A reading of approximately 6 volts indicates the line is good. A reading of 0 volts indicates the line is broken between the midpoint and the B+ side of the grid line. A reading of 12 volts indicates the circuit is broken between the midpoint of the grid line and ground.

6. Pinpointing the exact position of the break can be accomplished (if the voltmeter reads 0 volts when the midpoint of the grid line is touched with the positive lead of the voltmeter) by moving the positive lead of the voltmeter toward the B+ side of the grid line and touching the grid line until the voltmeter reads 12 volts.

If the voltmeter reads 12 volts when the midpoint of the grid line is touched with the positive lead of the voltmeter, simply move the positive lead of the voltmeter toward the ground connection of the grid line and touch the grid line until the voltmeter reads 0 volt.

---

**Window Grid Wire Repair**

## General Equipment

Polypropylene Film Fine Line Tape (Commercially available)

## Material

Item	Specification
Lacquer Touch-Up Paint (match color to exterior grid wire) PM-19500-XXXX	ESR-M2P100-C
Rear Window Defroster Repair PM-11 (US); CPM-11 (Canada)	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

**NOTE:** The grid line material is not embedded into the glass, but is baked to the glass surface and consequently can be scraped off. An undamaged grid line will have small ridges that project above the surface of the glass and can easily be felt when running a fingernail across them. Grid lines that have been "razor bladed" will feel smooth when a fingernail is dragged across the affected area. Inoperative lines may appear to the eye to be undamaged due to residue remaining on the glass and will require diagnosis with a voltmeter or 12V test lamp. For additional information, refer to Diagnosis and Testing in this section.

1. Bring the vehicle up to a room temperature of at least 16°C (60°F) or above.
2. **NOTICE: Do not use scrapers, sharp instruments or abrasive window cleaners on the interior surface of the rear window glass as this may cause damage to the grid lines.**

Clean the entire grid line repair area with glass cleaner and 0000 steel wool to remove all dirt, wax, grease, oil or other foreign material.

3. Mark the location of the grid break on the exterior of the rear window glass.

4. Using a polypropylene film fine line tape, mask the area directly above and below the grid break extending the tape 26 mm (1.02 in) beyond the concern area in both directions. The break area should be at the center of the mask.

5. **NOTE:** If the brown layer is not broken or missing, apply only the silver grid repair compound to the break. If both the brown and silver layers of the grid are broken or missing, apply a coating of the lacquer touch up paint across the break in the grid line prior to applying the rear window defroster repair compound. Do not overlap the silver grid line with the paint. Several applications may be necessary to achieve a color match.

**NOTE:** Allow at least 5 minutes of drying time between applications for the touch up paint or the silver repair coating. Applying fewer coats or not allowing adequate drying time between coats will produce repaired resistance that is greater than OEM resistance, resulting in poor defrost performance and excessive localized heating.

Apply the repair coating to the grid break area in several smooth, continuous strokes. Extend the silver repair coating at least 6.35 mm (0.25 in) on both sides of the break area. Apply a minimum of 6 applications of the grid repair compound.

6. **NOTE:** The repair coating air-dries in approximately one minute and can be energized after 5 minutes. Optimum adhesion occurs after approximately 24 hours.

Allow the repair area to dry completely and remove the mask.

7. **NOTICE:** Be careful not to damage the grid line with the razor blade. If this occurs, additional repair may be necessary.

Remove any excess repair compound above or below the grid line with a razor blade.

8. **NOTE:** The interior side of the grid lines are not painted, but due to the silver tarnishing will tend to change the grid to a gold or brown color. The repair area will be bright silver and will also tarnish over time to match the rest of the grid.

Test the system for normal operation.

**Lead Terminal Repair**

## General Equipment

Terminal Kit - Back Glass 4F1Z-14421-AA

## Material

Item	Specification
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Bring the vehicle up to room temperature of at least 16°C (60°F) or above.
2. **NOTE:** The new terminal will cover the original terminal location, but it must be placed so that the terminal conductive areas will be placed on a good conductive base.

Clean the bus bar in the area to be repaired with steel wool (000 to 0000 grade), and then with glass cleaner to remove all dirt, wax, grease, oil or other foreign material.

3. **NOTICE:** Do not use any type of flame torch or flame-heated soldering gun for this procedure. Use of these tools provide inadequate heat generation at the tip and the exhaust heat can cause damage to plastic trim parts in the area. Use only an electric soldering gun with 100 watts or more of power. Before using the soldering gun, be sure to melt a small amount of rosin core solder to the tip. The solder will assist in achieving better heat transfer from the soldering gun tip to the new terminal.

**NOTE:** Depending on the original terminal location, and whether the terminal is covered by pillar trim, will determine where to locate the new terminal. Some grid line bus bars may only allow the placement of the terminal above or below the original tab location due to space limitations. For most vehicle applications, the replacement tab location will cover the original tab location, but still allow the replacement tab to attach to the bus bar on good conductive material.

Place the replacement terminal type A over the original tab location, making sure the conductive areas of the terminal will be on a good conductive area. Do not place the terminal tab foot on the original location, which does not have conductive material.

4. Hold the terminal in place with an item such as a regular lead pencil at a 90 degree angle from the terminal. (Holding at other than a 90 degree angle may allow the terminal to slip when the solder liquefies.)

5. **NOTE:** The new terminal has pre-applied solder, flux and temperature-sensitive paint. The paint provides a visual indication when the terminal has reached the correct temperature to melt solder on the terminal. When the correct temperature is achieved, the temperature paint will liquefy and change color.

Place the soldering gun tip on the top of the terminal, but not on the painted areas of the tab. Energize the soldering gun and watch for the painted area of the terminal to liquefy and change color. The paint should liquefy in approximately 25-45 seconds after heating. As soon as the paint color completely changes on either side of the terminal, de-energize the soldering gun and continue to hold the terminal in place with the soldering gun and pencil for an additional 30 seconds.

6. Remove the soldering gun and pencil from the terminal. The terminal should be allowed to cool for another 2 minutes before the wiring lead is attached to the terminal.
7. Attach the electrical lead connection to this terminal, turn on the heated rear window and verify the operation.
-

## Window Glass Adjustment

### Front Door Window Glass Adjustment

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#).
2. Position the watershield aside.
3. Connect the window control switch electrical connectors.

4. Turn the ignition key to the ON position.
5. Partially lower the door glass.
6. Loosen the top regulator nuts a minimum of 3 full threads.

7. Loosen the 2 front door glass top run bolts a minimum of 3 full turns.

8. Cycle the glass to the full down position.
9. Cycle the glass to the full up position.
10. Inspect the window regulator stud location in the slots on the door inner sheet metal panel and make sure the regulator studs are located at the center of the slots.
11. With the regulator studs at the center of the slots, tighten the front door window regulator nuts to 12 Nm (106 lb-in).

12. Tighten the front door glass run channel bolts to 12 Nm (106 lb-in).

13. Cycle the window glass to verify the window functions correctly.
14. Turn the ignition key to the OFF position.
15. Disconnect the window control switch electrical connectors.
16. Reposition the watershield.
17. Install the front door panel. For additional information, refer to [Section 501-05](#).

### Rear Door Window Glass Adjustment

1. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#).
2. Position the watershield aside.
3. Connect the window control switch electrical connectors.
4. Turn the ignition key to the ON position.
5. Partially lower the door glass.
6. Loosen the top regulator nuts a minimum of 3 full threads.

7. Loosen the 2 rear door glass run bolts a minimum of 3 full threads.

8. Cycle the glass to the full down position.
9. Cycle the glass to the full up position.
10. Inspect the window regulator stud location in the slots on the door inner sheet metal panel and make sure the regulator studs are located at the center of the slots.
11. With the regulator studs at the center of the slots, tighten the rear door window regulator nuts to 6 Nm (53 lb-in).

12. Tighten the rear door glass run channel bolts to 10 Nm (89 lb-in).

13. Verify that the glass is in the correct position. For additional information, refer to Window Glass - Rear Quarter in this section.
  14. Cycle the window glass to verify the window functions correctly.
  15. Turn the ignition key to the OFF position.
  16. Disconnect the window control switch electrical connectors.
  17. Reposition the watershield.
  18. Install the rear door panel. For additional information, refer to Section 501-05.
-

**Glass Reseal - Windshield**

## Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Sika Urethane Adhesive Sika Tack ASAP	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the cowl panel grille. For additional information, refer to [Section 501-02](#) .
2. Remove the screws and LH and RH sun visors and clips.
3. Position the LH and RH front door weatherstrips aside.

4. Remove the LH and RH A-pillar trim panels.

5. If equipped, remove the overhead console. For additional information, refer to [Section 501-12](#) .
6. If equipped, remove the roof opening panel headliner retainer.

7. Partially lower the front portion of the headliner and block with a suitable material.

8. Clean the edge formed by the existing urethane adhesive and the glass on the inside at the top and sides and outside on the bottom of the windshield with glass cleaner.
9. Cut the urethane adhesive applicator tip to specification.

10. **NOTE:** Use either a high ratio, electric or battery-operated caulk gun that applies the urethane adhesive with less effort and continuous bead.

**NOTE:** Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.

Apply the urethane adhesive over the top of the existing urethane adhesive.

- Apply the urethane adhesive to the top and sides of the windshield from the interior of the vehicle.
- Apply the urethane adhesive to the bottom of the windshield from the exterior of the vehicle.

11. **NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

After the urethane adhesive cures, check the windshield seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.

12. Install the front portion of the headliner.
13. If equipped, install the roof opening panel headliner retainer.

14. If equipped, install the overhead console. For additional information, refer to [Section 501-12](#).
15. Install the LH and RH A-pillar trim panels.

16. Install the LH and RH front door weatherstrips.

17. Install the LH and RH sun visors and clips.
  18. Install the cowl panel grille. For additional information, refer to [Section 501-02](#) .
  19. Clean the exterior and interior of the windshield glass with glass cleaner.
-

**Glass Reseal - Rear**

## Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Sika Urethane Adhesive Sika Tack ASAP	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the package tray trim panel. For additional information, refer to [Section 501-05](#).
2. Disconnect the rear window glass electrical connectors.
3. Clean the interior and exterior of the windshield glass surface with glass cleaner.
4. Cut the urethane adhesive applicator tip to specification.

5. **NOTE:** Use either a high ratio, electric or battery-operated caulk gun that applies the urethane adhesive with less effort and continuous bead.

**NOTE:** Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.

Apply the urethane adhesive over the top of the existing urethane adhesive.

- Apply the urethane adhesive to the top and sides of the rear glass from the interior of the vehicle.
- Apply the urethane adhesive to the bottom of the rear glass from the exterior of the vehicle.

6. **NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

After the urethane adhesive cures, check the rear glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.

7. Connect the rear window glass electrical connectors.
8. Install the package tray trim panel. For additional information, refer to [Section 501-05](#).

Procedure revision date: 08/19/2009

## Windshield Glass

### Special Tool(s)

 ST1320-A	Deluxe Windshield Removal Tool 164-R2450 or equivalent
 ST2085-A	The Pumper 164-R2459 or equivalent

### Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Dow Urethane One Step Glass Primer Betaprime® 5500 / 5500A / 5500SA	-
Sika Urethane Adhesive Sika Tack ASAP	-
Sika Urethane Metal and Glass Primer Sika 206 G+P	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

Item	Part Number	Description
1	03144	Windshield moulding
2	03100	Windshield glass
3	381500	Windshield stop rivets (2 required)
4	03296	Windshield stops (2 required)

**Removal**

1. Remove the cowl panel grille. For additional information, refer to [Section 501-02](#) .
2. Remove the sun visors and clips.
3. Remove the RH and LH A-pillar trim panels.
4. Remove the instrument panel defroster opening grille.
  - If equipped, disconnect the electrical connectors.

5. Cover the defroster openings with tape to prevent contaminants from entering the defroster housing.
  6. Remove the interior rear view mirror. For additional information, refer to [Section 501-09](#) .
  7. If equipped, remove the overhead console. For additional information, refer to [Section 501-12](#) .
  8. Lower the front portion of the headliner.
  9. Cover the seats, instrument panel and hood to prevent possible damage.
  10. Before cutting the urethane adhesive, remove dirt and other foreign material from the windshield pinch weld area.
    - Use a clean shop towel or oil-free compressed air.
  11. **NOTE:** Refer to manufacturer's instructions before using the Deluxe Windshield Removal Tool.
- Lubricate the urethane adhesive with water to aid the Deluxe Windshield Removal Tool when cutting the urethane adhesive.
12. **⚠ WARNING:** Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

**NOTICE:** To avoid rust formation, use extreme care not to scratch the paint or primer, or otherwise damage the pinch weld during glass removal.

**NOTE:** Insert the blade into the Deluxe Windshield Removal Tool so that the flat side is against the glass. This will leave the entire urethane adhesive bead on the pinch weld and allow a dry fit of the

replacement windshield glass.

**NOTE:** Support the windshield glass as necessary to prevent the glass from dropping while cutting the urethane adhesive.

Insert the Deluxe Windshield Removal Tool at the upper center of the windshield glass and work toward the bottom corners.

13. Using The Pumper, distance the windshield glass from the body.

14. Using the Deluxe Windshield Removal Tool, cut the remaining urethane adhesive and remove the windshield glass.

15. Carefully remove the windshield glass from the vehicle and place on a stable work surface.

## Installation

1. Dry-fit the new windshield glass on the existing urethane adhesive bead on the pinch weld.
  - Position the windshield glass on the pinch weld.
  - Center the windshield glass in the opening.
  - Adjust the windshield glass stop blocks (if equipped) as needed for best fit.
  - Make alignment marks with tape or non-staining grease pencil (preferably at the windshield glass stop blocks if equipped) on the windshield glass and the body.
2. After the dry-fit alignment, remove the glass from the windshield opening and place on a stable work surface with the interior side of the glass facing up.
3. Using a clean shop towel, brush or oil-free compressed air, clean the pinch weld area around the existing urethane adhesive. Remove any foreign material or water that may have entered during windshield removal.

4. **⚠ WARNING:** Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

**NOTE:** Avoid scratching the pinch weld. Repair all minor scratches or exposed metal on the pinch weld, following manufacturer's instructions. Use the same brand pinch weld primer, glass primer and urethane adhesive.

Using an appropriate tool, trim the urethane adhesive leaving a 1-2 mm (0.04-0.08 in) in base of original equipment urethane adhesive on the pinch weld.

5. If reinstalling the same windshield glass, remove the remaining urethane adhesive from the glass leaving a thin layer to bond with the new urethane adhesive bead.
6. Clean the inside of the new windshield glass with glass cleaner.
7. **NOTE:** Be sure to use the same brand and cure-rate products for the urethane adhesive and glass primer. Do not mix different brands of urethane adhesive and glass primer. Refer to the Material Chart in this procedure.

If installing a new windshield glass, apply glass primer according to manufacturer's instructions. Allow at least 6 minutes to dry.

8. Cut the urethane adhesive applicator tip to specification.

9. **NOTE:** The windshield glass must be positioned within 10 minutes of applying the urethane adhesive.

**NOTE:** Use either a high-ratio, electric or battery-operated caulk gun that applies the urethane adhesive with less effort and a continuous bead.

Apply a bead of urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld, starting and ending at the bottom of the windshield near the center, making sure there are no gaps in the bead.

10. **⚠ WARNING:** Do not drive vehicle until the urethane adhesive seal has cured. Follow urethane adhesive manufacturer's curing directions. Inadequate or incorrect curing of the urethane adhesive seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

**NOTICE:** Before positioning the windshield glass, open vehicle windows to prevent the air pressure of closing doors from affecting the adhesive bond.

Using the alignment marks made previously, position the windshield glass on the pinch weld.

11. **NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

After the urethane adhesive cures, check the windshield glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.

12. Install the front portion of the headliner.
13. Install the interior rear view mirror. For additional information, refer to [Section 501-09](#).
14. If equipped, install the overhead console. For additional information, refer to [Section 501-12](#).
15. Remove the tape from the defroster housing.
16. Install the instrument panel defroster opening grille assembly.
- If equipped, connect the electrical connectors.

17. Install the RH and LH A-pillar trim panels.
18. Install the sun visors and clips.
19. Install the cowl panel grille. For additional information, refer to [Section 501-02](#).

**Window Glass - Front Door**

## Special Tool(s)

	Heavy Duty Riveter 501-D011 (D80L-23200-A) or equivalent
---	---

**Removal and Installation**

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#) .
2. Remove the speaker. For additional information, refer to [Section 415-00](#) .
3. Remove the screws and position the Driver Door Module (DDM) aside.

4. Position the upper and lower water shields aside.
5. Remove the rivets and position the door latch remote control aside.

6. Remove the 2 front door glass top run bolts.
  - To install, tighten to 12 Nm (106 lb-in).
7. Remove the inner belt line moulding.
8. Remove the nut and outer belt line moulding.
  - To install, tighten to 12 Nm (106 lb-in).
9. Position the front door glass run front retainer forward.
10. Connect the window control switch electrical connectors.
11. Lower the front door window glass to gain access to the rivets.

12. **NOTICE:** Do not attempt to forcibly remove the rivets as damage to the front door window glass will result.

**NOTE:** Before removing rivets, it is necessary to place a suitable block support between the front door window channel bracket and the door outer panel to help stabilize the front door window bracket during rivet removal.

Remove the 2 rivets.

13. Remove the front door window glass.

14. **NOTE:** If necessary, align the front door window glass with the front door window channel bracket.

To install, reverse the removal procedure.

- Using the Heavy Duty Riveter, install the 2 spacers and two 1/4 inch rivets (use of 1/4 - 20 x 1 inch screw and washer assemblies and 1/4 inch - 20 nut and washer are optional). Tighten the nut (if used) to 13 Nm (115 lb-in).

---

**Window Regulator and Motor - Front Door****Special Tool(s)**

 ST1132-A	Heavy Duty Riveter 501-D011 (D80L-23200-A) or equivalent
---	---

**Removal and Installation**

1. Remove the front door window glass. For additional information, refer to Window Glass - Front Door in this section.
2. Disconnect the front door window regulator motor electrical connector.
3. Remove the 2 front door window regulator rivets.

4. Remove the 3 front door window regulator motor bolts.
    - To install, tighten to 6 Nm (53 lb-in).
  5. Remove the 2 front door window regulator nuts.
    - To install, tighten to 12 Nm (106 lb-in).
  6. Remove the front door window regulator.
  7. To install, reverse the removal procedure.
    - Use the Heavy Duty Riveter to install the new rivets.
-

## Window Regulator Motor - Front Door

### Removal and Installation

1. Position the front door window glass in the full up position and secure with tape.
2. Remove the front door trim panel. For additional information, refer to [Section 501-05](#).
3. Remove the speaker. For additional information, refer to [Section 415-00](#).
4. Remove the 2 screws and position the Driver Door Module (DDM) aside.

5. Position the upper and lower watershields aside.
6. Disconnect the front door window regulator motor electrical connector.
7. Remove the 3 front door window regulator motor bolts.
  - To install, tighten to 6 Nm (53 lb-in).
8. Partially separate the window motor from the regulator, then press the release tab on the regulator and remove the window regulator motor.

9. To install, reverse the removal procedure.

## Door Glass Top Run - Front

### Removal and Installation

1. Remove the front door window glass. For additional information, refer to Window Glass - Front Door in this section.
2. Remove the front door window interior garnish moulding.
3. Remove the front door glass top run.

4. To install, reverse the removal procedure.
-

SECTION 501-11: Glass, Frames and  
Mechanisms  
REMOVAL AND INSTALLATION

2010 Crown Victoria, Grand Marquis Workshop  
Manual  
Procedure revision date: 08/19/2009

### Glass, Frames and Mechanisms - Exploded View, Rear Door

**NOTE:** RH rear door shown, LH rear door similar.

Item	Part Number	Description
1	25560 RH/ 25561 LH	Rear door window interior garnish moulding
2	25860 RH/ 25861 LH	Inner belt line moulding
3	N805296	Outer belt line moulding nut
4	25596 RH/ 25595 LH	Outer belt line moulding
5	N800510	Rear door glass top run inner bolt
6	W525175	Rear door window glass rivets (2 required)
7	234A44 RH/ 234A45 LH	Inner spacers (2 required)
8	234A46 RH/ 234A47 LH	Outer spacers (2 required)
9	N800510	Rear door glass top run outer bolt
10	25712 RH/ 25713 LH	Rear door window glass
11	W525172	Pull handle retainer bracket rivets (2 required)
12	22670	Pull handle retainer bracket
13	-	Rear door window regulator motor electrical connector (part of 14A005)
14	W525172	Rear door window regulator rivets (2 required)

		required)
15	N621906	Rear door window regulator nuts (2 required)
16	N808890	Rear door window regulator motor bolts (3 required)
17	27008 RH/ 27007 LH	Rear door window regulator
18	223396 RH/ 223395 LH	Rear door window regulator motor
19	26870	Rear door quarter glass and top run assembly

1. For additional information, refer to the procedures in this section.
-

**Window Glass - Rear Door**

## Special Tool(s)

 ST1132-A	Heavy Duty Riveter 501-D011 (D80L-23200-A) or equivalent
---	---

**Removal and Installation**

1. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#).
2. Position the watershields aside.
3. Remove the 3 rivets and position the rear door latch remote control aside.

4. Remove the inner belt line moulding.
5. Remove the nut and outer belt line moulding.
  - To install, tighten to 12 Nm (106 lb-in).
6. Remove the rear door glass top run inner bolt.
  - To install, tighten to 10 Nm (89 lb-in).
7. Connect the window control switch electrical connectors.
8. Lower the rear door window glass to gain access to the rivets.
9. **NOTICE:** Do not attempt to forcibly remove the rivets as damage to the rear door window glass may result. Prior to removing the rivet center pins, it is necessary to place a suitable block support between the door outer panel and the rear door window channel bracket to stabilize the rear door window glass during rivet removal.

Remove the 2 rear door window regulator rivets.

10. Remove the rear door glass top run outer bolt.
  - To install, tighten to 12 Nm (106 lb-in).
11. Remove the rear door window glass.

12. **NOTE:** If necessary, align the rear door window glass with the rear door window channel bracket.

To install, reverse the removal procedure.

- Using the Heavy Duty Riveter, install 2 spacers and two 1/4 inch rivets (use of 1/4 - 20 x 1 inch screw and washer assemblies and 1/4 inch - 20 nut and washer are optional). Tighten the nut (if used) to 13 Nm (115 lb-in).
-

---

**Window Regulator and Motor - Rear Door****Special Tool(s)**

 ST1132-A	Heavy Duty Riveter 501-D011 (D80L-23200-A) or equivalent
---	---

**Removal and Installation**

1. Remove the rear door window glass. For additional information, refer to Window Glass - Rear Door in this section.
2. Remove the 2 rivets and the pull handle retainer bracket.
3. Disconnect the rear door window regulator motor electrical connector.
4. Remove the 2 rear door window regulator rivets.

5. Remove the 2 rear door window regulator nuts.
  - To install, tighten to 6 Nm (53 lb-in).
6. Remove the 3 rear door window regulator motor bolts and the rear door window regulator.
  - To install, tighten to 6 Nm (53 lb-in).

7. To install, reverse the removal procedure.
  - Use the Heavy Duty Riveter to install the rivets.

---

**Window Regulator Motor - Rear Door**

## Special Tool(s)

 ST1132-A	Heavy Duty Riveter 501-D011 (D80L-23200-A) or equivalent
---	---

**Removal and Installation**

1. Position the rear door window glass in the full up position and secure with tape.
2. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#) .
3. Remove the 2 rivets and the pull handle retainer bracket.
4. Position the water shield aside.
5. Disconnect the rear door window regulator motor electrical connector.
6. **NOTE:** Use care not to enlarge the sheet metal holes in the door inner panel.

Remove the 2 rear door window regulator rivets.

7. **NOTE:** Working through the access hole, remove the window regulator motor bracket from the inner panel and slide the motor back to gain access to the screws.

Remove the 3 rear door window regulator motor bolts.

- To install, tighten to 6 Nm (53 lb-in).
8. Separate the window regulator motor from the window regulator and remove it from the rear door.
  9. To install, reverse the removal procedure.
    - Use the Heavy Duty Riveter to install the new rivets.
-

## Window Glass - Rear Quarter

### Removal

1. Remove the rear door window glass. For additional information, refer to Window Glass - Rear Door in this section.
2. **NOTE:** If the rear door window garnish moulding becomes kinked, it is no longer usable and a new moulding must be installed.

Remove the rear door window interior garnish moulding.

3. **NOTE:** Pull the quarter glass forward to loosen the rear door top glass run assembly.

Remove the rear door top glass run and quarter window glass as an assembly.

### Installation

1. **NOTE:** Make sure to install the quarter window glass into the glass channel.

Position the quarter glass into the door frame.

2. **NOTE:** For correct rear door glass fit and function, the glass run division bar locator must be fully forward in the rear door header notch.

Install the window division bar.

3. Push the run firmly into the C-pillar flange.

4. Install the run at the B-pillar upper corner.

5. Push the run into the B-pillar flange.

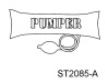

6. Push the run into the header of the door.

7. Install the side glass into the glass run. For additional information, refer to Window Glass - Rear Door in this section.
-

**Window Glass - Rear**

## Special Tool(s)

	The Pumper 164-R2459 or equivalent
	Deluxe Windshield Removal Tool 164-R2450 or equivalent

## Material

Item	Specification
Dow Urethane Adhesive Betaseal® Express	-
Dow Urethane One Step Glass Primer Betaprime® 5500 / 5500A / 5500SA	-
Sika Urethane Adhesive Sika Tack ASAP	-
Sika Urethane Metal and Glass Primer Sika 206 G+P	-
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

Item	Part Number	Description
1	-	Rear window glass electrical connectors (part of 14A005)
2	42006	Rear window glass
3	42404	Rear window glass moulding
4	N805227	Rear window glass rivets (2 required)
5	42308	Rear window glass stops (2 required)

**Removal**

1. Remove the package tray trim panel. For additional information, refer to [Section 501-05](#).
2. Disconnect the rear window glass electrical connectors.
3. Using a soft brush or vacuum, clean any dirt or foreign material from the pinch weld.
4. **NOTE:** Refer to manufacturer's instructions before using the Deluxe Windshield Removal Tool.

Lubricate the existing urethane adhesive with water using a spray bottle to aid the Deluxe Windshield Removal Tool while cutting.

5. **⚠ WARNING:** Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

**NOTICE:** To avoid rust formation, use extreme care not to scratch the paint or primer or otherwise damage the pinch weld during glass removal.

**NOTE:** Insert the blade into the Deluxe Windshield Removal Tool so that the flat side is against the glass. This will leave the entire urethane adhesive bead on the pinch weld and allow a dry fit of the replacement rear glass.

**NOTE:** Support the rear glass as necessary to prevent the glass from dropping while cutting the urethane adhesive.

Using the Deluxe Windshield Removal Tool, starting at the top center of the rear window glass, cut the urethane adhesive from the glass and work down the sides.

6. Using The Pumper, distance the rear window glass from the body.

7. Using the Deluxe Windshield Removal Tool, cut the remaining urethane adhesive and remove the rear window glass

## Installation

**NOTE:** For additional material guidelines, refer to the manufacturer's installation information.

1. Dry-fit the rear window glass by centering it side-to-side and by adjusting the blocks (if equipped) to get the correct position of the part top-to-bottom. Make alignment marks with tape or non-staining grease pencil on both the glass and the vehicle body.
2. **⚠ WARNING: Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

**NOTE:** Avoid scratching the pinch weld. Repair all minor scratches or exposed metal on the pinch weld following manufacturer's instructions. Use the same brand pinch weld primer, glass primer and urethane adhesive.

Using an appropriate tool, trim the urethane adhesive leaving a 1-2 mm (0.04-0.08 in) base of original equipment urethane adhesive on the pinch weld.

3. If reinstalling the original rear window glass, remove any excess urethane adhesive from the glass.
4. If installing a new rear window glass, clean the inside of the glass surface with glass cleaner to make sure the ceramic-coated area is clean.
5. **NOTE:** Be sure to use the same brand of cure-rate products for the urethane adhesive and glass primer. Do not mix different brands of urethane adhesive and glass primer. Refer to the Material Chart in the procedure.

If installing a new rear window glass, apply glass primer according to the manufacturer's instructions. Allow at least 6 minutes to dry.

6. Cut the urethane adhesive applicator tip to specification.

7. **NOTE:** Use either a high-ratio, electric or battery-operated caulk gun that applies the urethane adhesive with less effort and a continuous bead.

Apply urethane adhesive on top of the existing urethane adhesive bead on the pinch weld, starting and ending at the bottom of the rear window glass near the center, making sure there are no gaps in the bead.

8. **NOTICE:** Before positioning the rear window glass, open vehicle windows to prevent the air pressure or closing doors from affecting the urethane adhesive bond.

Using the alignment marks, install the rear window glass.

9. **⚠ WARNING:** Do not drive vehicle until the urethane adhesive seal has cured. Follow urethane adhesive manufacturer's curing directions. Inadequate or incorrect curing of the urethane adhesive seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

**NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

After the urethane adhesive has cured, check the rear window glass seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.

10. Connect the rear window glass electrical connectors.
11. Install the package tray trim panel. For additional information, refer to [Section 501-05](#).

**Window Control Switch**

Item	Part Number	Description
1	14527	Window regulator switch housing
2	-	Window regulator switch housing electrical connectors (part of 14A005)
3	14529	Window regulator switch

**Removal and Installation**

1. **NOTE:** Left front door shown, all others similar.

Lift the front of the switch plate from the front door trim panel and position it aside.

2. Disconnect the electrical connectors.
3. Release the 4 locking tabs and remove the window control switch.
4. To install, reverse the removal procedure.

**Torque Specifications**

<b>Description</b>	<b>Nm</b>	<b>lb-ft</b>	<b>lb-in</b>
Bulkhead electrical connector bolt	5	-	44
Glove compartment hinge bolts	3	-	27
Instrument cluster finish panel screws	3	-	27

SECTION 501-12: Instrument Panel and  
Console  
REMOVAL AND INSTALLATION

2010 Crown Victoria, Grand Marquis Workshop  
Manual  
Procedure revision date: 08/19/2009

### Instrument Panel - Exploded View

Item	Part Number	Description
1	390018	Parking brake release handle pushpin retainer
2	W707627	Pin-type retainer
3	04459	Steering column opening trim panel
4	-	Courtesy lamp socket (part of 14401)
5	N811610	Instrument panel steering column reinforcement screws (5 required)
6	04502	Instrument panel steering column reinforcement
7	-	Electrical connectors (part of 14401) (3 required)
8	-	Bulkhead electrical connector (part of 14401)
9	N806423	Intermediate shaft pinch bolt
10	045E24	Steering column brace nut
11	N621481	Instrument panel tunnel brace nuts (2 required)
12	388930	Instrument panel lower insulator pin-type retainers (2 required)
13	043A88	Instrument panel lower insulator
14	-	Courtesy lamp socket (part of 14401)

15	18812	Antenna cable
16	19D888	Electronic automatic temperature control hose (if equipped)
17	-	Electrical connectors (part of 14401) (3 required)
18	W705661	Instrument panel wiring harness ground bolts (3 required)
19	19C827	Climate control head vacuum harness connector
20	044E82	Instrument panel defroster opening grille
21	-	Sun load/auto lamp sensor electrical connector (if equipped) (part of 14401)
22	W707627	Instrument panel cowl top screws (3 required)
23	N620482	LH instrument panel cowl side nut
24	N804385	LH instrument panel cowl side lower bolt
25	N620480	RH instrument panel cowl side lower nut
26	04320	Instrument panel

1. For additional information, refer to the procedures in this section.
-

## Instrument Panel

### Removal and Installation

#### All vehicles

1. Place the selector lever in the No. 1 position.
2. Remove the steering wheel. For additional information, refer to [Section 211-04](#).
3. From under the hood, loosen the bolt and disconnect the LH bulkhead electrical connector.
  - To install, tighten to 5 Nm (44 lb-in).

4. Release the retainers and position the bulkhead electrical connector through the dash panel.

#### Vehicles with Police option

5. Remove the Battery Junction Box (BJB) wiring harness ties, disconnect the electrical connector and position the harness aside.

#### All vehicles

6. Remove the 2 pin-type retainers, disconnect the power point electrical connector and remove the RH instrument panel lower insulator.
7. Disconnect the RH lower instrument panel courtesy lamp.
8. Position the LH and RH front door weatherstrip seals aside.
9. Remove the LH and RH scuff plates.
10. Remove the LH and RH A-pillar lower trim panels.
11. Disconnect the antenna cable in-line connector.

12. Remove the 3 RH instrument panel wiring harness ground bolts.
13. Disconnect the 3 RH instrument panel wiring harness electrical connectors.
14. If equipped, disconnect the Electronic Automatic Temperature Control (EATC) hose from the evaporator housing.

15. Disconnect the climate control head vacuum harness connector.
16. Remove the pin-type retainer and the steering column opening trim panel.
17. Remove the 5 screws and the instrument panel steering column reinforcement.
  - To install, tighten to 9 Nm (80 lb-in).
18. Remove the nut and position the steering column brace aside.
  - To install, tighten to 30 Nm (22 lb-ft).
19. Remove and discard the intermediate shaft pinch bolt.
  - Separate the intermediate shaft from the steering column shaft.
  - Install a new intermediate shaft pinch bolt and tighten to 30 Nm (22 lb-ft).
20. Disconnect the selector lever cable from the steering column.
  1. Disconnect the cable from the steering column shift tube lever.
  2. Disconnect the cable from the steering column bracket.

21. Disconnect the 3 LH instrument panel wiring harness electrical connectors.
22. Remove the pin-type retainer and the instrument panel tunnel brace cover.
23. Remove the 2 nuts and the instrument panel tunnel brace.
  - To install, tighten to 15 Nm (133 lb-in).
24. Remove the defroster opening grille.
  - If equipped, disconnect the electrical connectors.
25. Remove the 3 instrument panel cowl top screws.
26. Remove the RH instrument panel cowl side lower nut.
  - To install, tighten to 12 Nm (106 lb-in).

27. Remove the LH instrument panel cowl side upper nut.

- To install, tighten to 55 Nm (41 lb-ft).

28. Remove the LH instrument panel cowl side lower bolt.

- To install, tighten to 55 Nm (41 lb-ft).

29. **NOTE:** An assistant is needed to carry out this step.

Remove the instrument panel from the vehicle.

30. To install, reverse the removal procedure.

---

**Instrument Cluster Finish Panel**

Item	Part Number	Description
1	046A62	RH instrument panel finish panel
2	-	Passenger airbag module electrical connector (part of 14401)
3	-	Function set-up switch electrical connectors (part of 14401) (2 required)
4	-	Rear window defrost switch electrical connector (part of 14401)
5	046A63	LH instrument panel finish panel
6	2A713	Traction control switch electrical connector (part of 14401)
7	N807122	Instrument cluster finish panel screw (8 required)
8	044D70	Instrument cluster finish panel

**Removal and Installation**

1. Place the selector lever in the No. 1 position.
2. **NOTE:** The ignition switch must be in the OFF position if disconnecting the Passenger Air Bag Deactivation (PAD) indicator electrical connector. Otherwise, a DTC will be set in the Restraints Control Module (RCM) memory and must be cleared before releasing the vehicle.  
  
Position the ignition switch in the OFF position and wait at least one minute.
3. Remove the audio unit. For additional information, refer to [Section 415-00](#) .
4. Remove the RH instrument panel finish panel and disconnect the 3 electrical connectors.
5. Remove the LH instrument panel finish panel and disconnect the electrical connector.
6. Tilt the steering column in the full down position.

7. Remove the 8 screws and the instrument cluster finish panel.
    - Disconnect the electrical connectors.
  8. To install, reverse the removal procedure.
-

**Console - Overhead**

Item	Part Number	Description
1	13562	Overhead console
2	W701679	Overhead console electrical connectors (part of 14334) (2 required)

**Removal and Installation**

**⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

1. **NOTICE:** The overhead console bracket is supported by the headliner. Failure to follow the removal procedure will damage the headliner.

Support the headliner at the rear corner of the overhead console and pull down on that corner to remove the overhead console.

- Disconnect the 2 electrical connectors.

2. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.

To install, reverse the removal procedure.

- To install, make sure to align the overhead console retaining clips to the retaining clip holes in the headliner bracket.

SECTION 501-14: Handles, Locks, Latches and Entry  
Systems  
SPECIFICATIONS

2010 Crown Victoria, Grand Marquis  
Workshop Manual  
Procedure revision date: 08/19/2009

Material

Item	Specification	Fill Capacity
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B	-
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-	-

**Torque Specifications**

Description	Nm	lb-in
Door latch screws	6	53
Hood latch bolts	12	106
Hood latch release cable handle bolt	5	44
Hood latch release cable handle nut	5	44
Hood latch striker bolts	12	106
Luggage compartment lid latch bolts	12	106

## **Handles, Locks, Latches and Entry Systems**

### **Hood Latch**

The hood latch consists of the following components:

- Hood latch
- Hood latch striker
- Hood latch release handle and cable

### **Front Door**

The front door consists of the following components:

- Actuating rods
- Door ajar switches
- Door latch remote control and links
- Door lock actuators
- Door lock cylinder
- Exterior door handles
- Front door latches
- Front door lock push button rods
- Interior door handles

### **Rear Door**

The rear door consists of the following components:

- Door ajar switches
- Door latch remote control and links
- Door lock actuators
- Exterior door handles
- Interior door handles (part of the door trim panel)
- Rear door latches
- Rear lock rod and bell crank

### **Luggage Compartment**

The luggage compartment system consists of the following components:

- Luggage compartment lid latch
- Luggage compartment lid lock cylinder
- Luggage compartment lid release switch (located on the driver door panel)

The luggage compartment lid latch is equipped with a mechanical interior release handle (located on the latch).

The luggage compartment lid can be released with the Remote Keyless Entry (RKE) transmitter (if equipped), the keyless entry keypad (if equipped), the luggage compartment lid release switch, or the luggage compartment lid lock cylinder.

## **Lock Cylinders**

Individual lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

## **Autolock**

The autolocking function automatically locks all doors when all of the following conditions are concurrently met during the current key cycle:

- All the doors are closed
- The autolocking function is active
- The ignition switch is in the RUN position
- The transmission is in any forward gear
- The vehicle speed exceeds 5 km/h (3 mph)

After the initial activation of autolocking and at least one door has been opened, autolocking is activated again if the following conditions are concurrently met:

- All the doors are closed
- The autolocking function is active
- The ignition switch is in the RUN position
- The transmission is in any forward gear
- The vehicle speed exceeds 5 km/h (3 mph)

## **Auto-Unlock**

The auto-unlocking function automatically unlocks all the doors when the following conditions are met:

- The vehicle speed has exceeded 5 km/h (3 mph) then dropped to 0 km/h (0 mph)
- The key is turned to the OFF or ACC position
- The driver door is opened within 10 minutes of the key being turned to the OFF or ACC position

The auto-unlock feature is cancelled if the doors are locked with the door lock control switch or the RKE transmitter within the 10-minute active window. After the 10-minute active window expires, the auto-unlock feature does not unlock the doors if the driver door is opened.

## **Smart Unlock**

The smart unlock feature prevents the driver door from locking with the key in the ignition lock cylinder. When the Driver Door Module (DDM) receives a LOCK command from a door lock control switch, and the key is in the ignition lock cylinder with the driver door open, the DDM commands all the doors to lock, then unlock.

## **Unlock Inhibit Feature**

The unlock inhibit feature disables the interior door lock control switches and the interior luggage compartment lid release button when the perimeter alarm becomes armed. Once the interior switches are disabled, they can only become active once the perimeter alarm is disarmed.

## **Remote Keyless Entry (RKE)**

The RKE system consists of the following components:

- DDM
- Tire Pressure Monitoring System (TPMS)/ RKE antenna (located on the RH C-pillar)
- RKE transmitter

The RKE transmitter initiates the following electronic system functions:

- Releases the luggage compartment lid
- Unlocks the driver door
- Unlocks all doors
- Locks all doors.
- Arms/disarms the perimeter alarm or inhibits the alarm for the luggage compartment
- Activates/deactivates the panic alarm
- Commands the interior lamps on (when unlocking) and off (when locking)
- Sounds the horn once when LOCK is pressed twice within 3 seconds, and the hood, luggage compartment lid and doors are closed
- Sounds the horn twice when LOCK is pressed twice within 3 seconds if any door, hood or luggage compartment lid is not closed

The RKE transmitter has a normal operating range of 10 m (33 ft).

The RKE transmitters can be programmed using a scan tool or by using the ignition lock cylinder method. Refer to Remote Keyless Entry (RKE) Transmitter Programming in this section for programming information.

### **Remote Keyless Entry (RKE) Lock/Unlock Control - Unlock**

The RKE transmitter feature provides lock/unlock functions independently of the key position and the vehicle speed. The RKE transmitter feature provides a 2-step process for unlocking the doors. Upon receipt of the first request for unlocking the doors, the remote control feature requests the DDM to unlock the driver door only. If another unlock request is received within 3 seconds of the first, the RKE transmitter feature requests that all doors be unlocked.

### **Remote Keyless Entry (RKE) Lock/Unlock Control - Lock**

The RKE transmitter feature requests that all the doors be locked when the LOCK button on the RKE transmitter is pressed. On any press of the LOCK button with all doors closed, the RKE feature requests one flash of the parking lamps. If any door is ajar, no flash occurs, indicating the DDM locked all the doors but one or more doors are ajar. When the last door is closed, the vehicle provides one flash of the parking lamps. If 2 presses of the LOCK button are received within 3 seconds, the horn chirps once, and the parking lamps flash to indicate that all the doors are closed and locked. If any door is ajar when the second lock request is received within 3 seconds of the first, the RKE transmitter feature requests the horn chirp twice without flashing the parking lamps to indicate it locked all the doors but one or more doors are ajar. When the key is in the RUN or START position, no parking lamp flashes or horn chirp confirmations occur.

### **Remote Keyless Entry (RKE) Luggage Compartment Lid Release**

The RKE feature provides a luggage compartment lid release. The feature operates regardless of key position. The feature is inhibited when the vehicle speed is 5 km/h (3 mph) or greater.

## **Panic Alarm**

The panic alarm feature provides audible and visual alarms which are evident from the exterior of the vehicle. The panic alarm feature requests that the parking lamps flash and the horn sounds until deactivation. The flashing of the outputs occurs simultaneously. The panic alarm is activated by pressing the PANIC button on an RKE transmitter when the key is in the OFF position, or the key is out of the ignition lock cylinder. At all other times this feature is disabled. The panic alarm is deactivated by: a second press of the RKE transmitter PANIC button, the key is switched out of the OFF position, or a period of 2 minutes and 45 seconds has elapsed since the initial activation.

## **Keyless Entry Keypad**

The keypad does not operate if the driver door is ajar.

The keypad provides a method for the customer to access the vehicle without a key or RKE transmitter. The keyless entry keypad feature:

- locks all doors.
- unlocks only the driver door.
- unlocks all doors.
- programs/erases the customer key code.
- enables/disables autolocking and auto-unlocking.
- arms/disarms the perimeter alarm.
- releases the luggage compartment lid latch.

The keypad feature operates independently of the key position status. When a keypad button is pressed, the keypad buttons illuminate to provide better visibility. If the 7/8 and 9/0 buttons are pressed simultaneously to lock all doors or 5 seconds have elapsed since the last button press, the illumination is turned off.

Each vehicle equipped with a keypad is programmed with a 5-digit factory set entry code. This code is provided to the customer on a wallet card. In addition, this code is available through a scan tool. When entering codes, each digit must be entered within 5 seconds of the previous button press. In addition to the factory set code, 3 personal keyless entry keypad codes can be set. For information on programming the personal keyless entry codes, refer to Keyless Entry Keypad Code Programming in this section.

## **Unlocking the Doors with the Keyless Entry Keypad System**

To unlock the driver door, enter either the factory set code or the personal code (each digit must be pressed within 5 seconds of the prior digit). The interior lamps will illuminate.

To unlock all doors, enter either the factory set code or the personal code (driver door unlocks) and press the 3/4 button within 5 seconds.

## **Locking the Doors with the Keyless Entry Keypad System**

It is not necessary to enter the factory set or personal code prior to locking all doors. To lock all doors, press the 7/8 and 9/0 buttons at the same time.

## **Releasing the Luggage Compartment Lid with the Keyless Entry Keypad System**

To release the luggage compartment, enter the factory set or the personal code and the driver door will unlock. Press the 5/6 button within 5 seconds.

## **Anti-Scan Feature**

To provide added security, the keyless entry keypad is disabled for 1 minute after 35 button presses without a valid entry code being entered. The keypad flashes during this 1-minute mode with all functionality disabled except for the 7/8 and 9/0 buttons still being allowed to lock the vehicle.

Anti-scan is turned off after 1 minute of keypad inactivity or if the doors are electronically unlocked using an RKE transmitter or a door lock control switch.

---

**Handles, Locks, Latches and Entry Systems**

## Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025D or equivalent

## Material

Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

**Principles Of Operation****Power Locks**

The power lock/unlock feature requests all of the vehicle doors to lock or unlock upon a request from the door lock control switch, the keyless entry keypad, or the Remote Keyless Entry (RKE) transmitter. Power locking and unlocking functions independently of the key position, the vehicle speed or the transmission position. The Driver Door Module (DDM) activates internal relays to supply the correct power and grounds for the door lock actuators.

**Opening the Luggage Compartment Lid with the Luggage Compartment Lid Release Switch****Without Police Package**

The luggage compartment lid can be released with the RKE transmitter, the keyless entry keypad, the luggage compartment lid release switch (with the key in the ON position) or the luggage compartment lid lock cylinder.

**With Police Package**

The luggage compartment lid can only be released with the luggage compartment lid release switches or the luggage compartment lid lock cylinder. The RKE luggage compartment lid release function is disabled on Police package vehicles.

**Remote Keyless Entry (RKE)**

The DDM interprets radio frequency signals from the RKE transmitters. The DDM requests the illuminated entry feature to turn the interior lamps on when an unlock command is received.

The RKE transmitter supplies a signal to the Tire Pressure Monitoring System (TPMS) / RKE antenna when any button is pressed. The TPMS / RKE antenna is hardwired to the DDM and sends the RKE signal to the DDM. The DDM interprets the RKE signal then supplies voltage to the appropriate door lock actuator(s) to lock or unlock the doors or release the luggage compartment lid. The RKE transmitter can also be used to activate the panic alarm.

**Keyless Entry Keypad**

The keyless entry keypad is hardwired to the DDM. The DDM interprets the inputs from the keyless entry keypad and then controls the associated operation. The keyless entry keypad is illuminated for 5 seconds when any button is pressed. The DDM requests the illuminated entry feature to turn the interior lamps on when a valid entry code is received. If a lock all doors code is entered, the illuminated entry feature turns off.

**NOTE:** The keyless entry keypad does not lock the doors if the driver door is ajar.

The keyless entry keypad supplies a signal to the DDM when the buttons are pressed. The DDM then supplies voltage to the appropriate door lock actuator(s) to lock or unlock the doors or release the luggage compartment lid.

**Inspection and Verification**

**⚠ WARNING:** If equipped with fire suppression system, refer to **Section 419-03** for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

**Visual Inspection Chart**

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Binding latches</li> <li>• Door handles</li> </ul>	<ul style="list-style-type: none"> <li>• Battery Junction Box (BJB) fuse(s):               <ul style="list-style-type: none"> <li>◆ 8 (20A)</li> <li>◆ 601 (20A) (circuit breaker)</li> <li>◆ 602 (20A) (circuit breaker)</li> </ul> </li> <li>• Central Junction Box (CJB) fuse 2 (7.5A)</li> <li>• Wiring, terminals or connectors</li> <li>• Door lock control switches</li> <li>• Keyless entry keypad</li> </ul>

| <ul style="list-style-type: none"> <li>• Luggage compartment lid release switch</li> </ul> |
|--|

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM .
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:

- Verify the ignition key is in the ON position.
- Verify the scan tool operation with a known good vehicle.
- Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
- If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the Driver Door Module (DDM) and Lighting Control Module (LCM).

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC	Description	Action
U1197	SCP (J1850) Invalid or Missing Data For Door Locks	This DTC is set when the Lighting Control Module (LCM) receives an invalid or missing door lock message from the Driver Door Module (DDM). REPAIR all non-network DTCs. REFER to <u>Section 419-10</u> for a list of all DTCs.
U1199	SCP (J1850) Invalid or Missing Data for External Access (Doors)	This DTC is set when the LCM receives invalid or missing door ajar status from the DDM . REPAIR all non-network DTCs. REFER to <u>Section 419-10</u> for a list of all DTCs.
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in <u>Section 419-10 .</u>

### Symptom Chart

Symptom Chart - Electrical

## Symptom Chart - Mechanical

**Pinpoint Tests****Pinpoint Test A: All Door Locks Are Inoperative**

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

**Normal Operation**

The Battery Junction Box (BJB) fuse 8 (20A) provides voltage for the power lock/unlock system and the luggage compartment lid latch (on vehicles without the police package). Based on inputs from the door lock control switches, Remote Keyless Entry (RKE) Transmitter, or keyless entry keypad (if equipped) the Driver Door Module (DDM) locks or unlocks the doors. Upon a lock request, the DDM supplies voltage on the all door lock circuit and ground on the driver and passenger door unlock circuits. Upon an unlock request, the voltage and ground are reversed on the previously listed circuits. When the door lock and unlock relays are not energized they are connected to ground. A dedicated DDM ground circuit is provided only for the lock and unlock relays.

**This pinpoint test is intended to diagnose the following:**

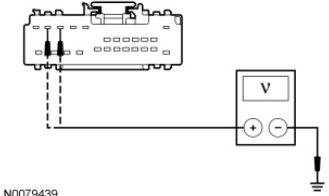

- Fuse
- Wiring, terminals or connectors
- Luggage compartment lid latch
- DDM

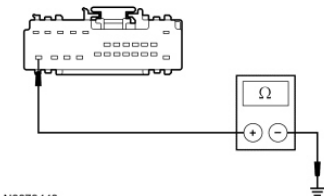

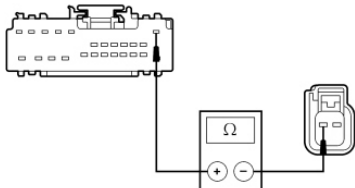

**PINPOINT TEST A: ALL DOOR LOCKS ARE INOPERATIVE**

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
<b>A1 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES</b>	
<ul style="list-style-type: none"> <li>• Press the lock and unlock button of both door lock control switches while observing the door lock operation.</li> <li>• <b>Are the door locks inoperative from both switches?</b></li> </ul>	<p><b>Yes</b> GO to <u>A2</u> .</p> <p><b>No</b> GO to <u>Pinpoint Test D</u> .</p>
<b>A2 RETRIEVE THE RECORDED DDM DTCs FROM THE SELF-TEST</b>	
<ul style="list-style-type: none"> <li>• Check for recorded DDM DTCs from the self-test.</li> <li>• <b>Are any DTCs retrieved?</b></li> </ul>	<p><b>Yes</b> REFER to DTC Charts in this section.</p> <p><b>No</b> GO to <u>A3</u> .</p>

<b>A3 CHECK FOR VOLTAGE TO THE DDM</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: DDM C501b.</li> <li>• Measure the voltage between the DDM C501b-10, circuit 1213 (WH/LB), harness side and ground; and between the DDM C501b-11, circuit 1213 (WH/LB), harness side and ground.</li> </ul>  <p>N0079439</p> <ul style="list-style-type: none"> <li>• <b>Are the voltages greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <a href="#">A7</a> .</p> <p><b>No</b> VERIFY the BJB fuse 8 (20A) is OK.</p> <p>If OK, REPAIR circuit 1213 (WH/LB) for an open. TEST the system for normal operation.</p> <p>If not OK (vehicles without the police package), GO to <a href="#">A4</a> .</p> <p>If not OK (vehicles with the police package), GO to <a href="#">A6</a> .</p>
<b>A4 CHECK THE LUGGAGE COMPARTMENT LID RELEASE OUTPUT CIRCUIT FOR A SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>• Connect: DDM C501b.</li> <li>• <b>NOTE:</b> If the BJB fuse 8 (20A) fails immediately, repair circuit 1213 (WH/LB) for a short to ground.</li> <li>• Install a new BJB fuse 8 (20A).</li> <li>• Operate the luggage compartment lid release by pressing the luggage compartment lid release switch.</li> <li>• <b>Is the BJB fuse 8 (20A) OK?</b></li> </ul>	<p><b>Yes</b> GO to <a href="#">A6</a> .</p> <p><b>No</b> GO to <a href="#">A5</a> .</p>
<b>A5 CHECK THE LUGGAGE COMPARTMENT LID RELEASE SOLENOID</b>	
<ul style="list-style-type: none"> <li>• Connect: Luggage Compartment Lid Latch C430.</li> <li>• Install a new BJB fuse 8 (20A).</li> <li>• Operate the luggage compartment lid release by pressing the luggage compartment lid release switch.</li> <li>• <b>Is the BJB fuse 8 (20A) OK?</b></li> </ul>	<p><b>Yes</b> INSTALL a new luggage compartment lid latch. REFER to <a href="#">Luggage Compartment Lid Latch</a> in this section. TEST the system for normal operation.</p> <p><b>No</b> REPAIR circuit 84 (VT/YE) for a short to ground. TEST the system for normal operation.</p>
<b>A6 CHECK THE ALL LOCK CIRCUIT FOR A SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>• Connect: DDM C501b.</li> <li>• <b>NOTE:</b> If the BJB fuse 8 (20A) fails immediately, repair circuit 1213 (WH/LB) for a short to ground.</li> <li>• Install a new BJB fuse 8 (20A).</li> <li>• Operate the door lock actuators by pressing LOCK on the door lock control switch.</li> <li>• <b>Is the BJB fuse 8 (20A) OK?</b></li> </ul>	<p><b>Yes</b> REPAIR circuit 118 (PK/OG) or circuit 163 (RD/OG) for a short to ground. TEST the system for normal operation.</p> <p><b>No</b> REPAIR circuit 117 (PK/BK) for a short to ground. TEST the system</p>

	for normal operation.
<b>A7 CHECK THE DDM GROUND CIRCUIT FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Disconnect: Negative Battery Cable.</li> <li>• Measure the resistance between the DDM C501b-24, circuit 57 (BK), harness side and ground.</li> </ul>  <p>N0079440</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p><b>Yes</b> GO to <a href="#">A8</a> .</p> <p><b>No</b> REPAIR circuit 57 (BK) for an open. TEST the system for normal operation.</p>
<b>A8 CHECK THE ALL LOCK CIRCUIT FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Disconnect: LH Front Door Lock Actuator C525.</li> <li>• Measure the resistance between the DDM C501b-1, circuit 117 (PK/BK), harness side and the LH front door lock actuator C525-2, circuit 117 (PK/BK), harness side.</li> </ul>  <p>N0027101</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p><b>Yes</b> GO to <a href="#">A9</a> .</p> <p><b>No</b> REPAIR circuit 117 (PK/BK) for an open. TEST the system for normal operation.</p>
<b>A9 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <a href="#">Section 419-10</a> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

**Pinpoint Test B: A Single/More Than One Door Lock Is Inoperative**

Refer to Wiring Diagrams Cell [110](#) , Power Door Locks for schematic and connector information.

**Normal Operation**

The Battery Junction Box (BJB) fuse 8 (20A) provides voltage for the power lock/unlock system and the luggage compartment lid latch (on vehicles without the police package). Based on inputs from the door lock control switches, Remote Keyless Entry (RKE) transmitter or keyless entry keypad (if equipped) the Driver Door Module (DDM) locks or unlocks the doors. Upon a lock request, the DDM supplies voltage on the all door lock circuit and ground on the driver and passenger door unlock circuits. Upon an unlock request, the voltage and ground are reversed on the previously listed circuits. When the door lock and unlock relays are not energized they are connected to ground. A dedicated DDM ground circuit is provided only for the lock and unlock relays.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Door lock actuator
- DDM

**PINPOINT TEST B: A SINGLE/MORE THAN ONE DOOR LOCK IS INOPERATIVE**

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>B1 CHECK THE DOOR LATCH FOR BINDING</b>	
<ul style="list-style-type: none"> <li>• Lock and unlock the inoperative door lock using the door lock rod.</li> <li>• <b>Does the door lock and unlock?</b></li> </ul>	<p><b>Yes</b> GO to <u>B3</u> .</p> <p><b>No</b> GO to <u>B2</u> .</p>
<b>B2 CHECK THE LOCK ROD FOR BINDING</b>	
<ul style="list-style-type: none"> <li>• Operate the door lock rod manually while observing the door lock rod for any binding or if the rod is bent.</li> <li>• <b>Is the door lock rod bent or binding?</b></li> </ul>	<p><b>Yes</b> REPAIR as necessary. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new door latch. REFER to <u>Front Door Latch</u> or <u>Rear Door Latch</u> in this section. TEST the system for normal operation.</p>
<b>B3 CHECK THE ALL LOCK CIRCUIT FOR VOLTAGE</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Inoperative Door Lock Actuator.</li> <li>• <b>NOTE:</b> The DDM only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.</li> <li>• While pressing the door lock control switch in the LOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows:</li> </ul>	<p><b>Yes</b> GO to <u>B4</u> .</p> <p><b>No</b> REPAIR circuit 117 (PK/BK) for an open. TEST the system for normal operation.</p>

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-2	117 (PK/BK)
RH front	C603-2	117 (PK/BK)
LH rear	C704-2	117 (PK/BK)
RH rear	C804-2	117 (PK/BK)

N0075565

- Is the voltage momentarily greater than 10 volts?

**B4 CHECK THE UNLOCK CIRCUITS FOR VOLTAGE**

- **NOTE:** The DDM only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.
- While pressing the door lock control switch in the UNLOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows:

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-1	163 (RD/OG)
RH front	C603-1	118 (PK/OG)
LH rear	C704-1	118 (PK/OG)
RH rear	C804-1	118 (PK/OG)

**Yes**

INSTALL a new door lock actuator. REFER to Front Door Lock Actuator or Rear Door Lock Actuator in this section. TEST the system for normal operation.

**No**

GO to B5 .

N0075564

- Is the voltage momentarily greater than 10 volts?

**B5 CHECK THE UNLOCK CIRCUITS FOR AN OPEN**

- Disconnect: DDM C501b.
- Measure the resistance between the inoperative door lock actuator, harness side and the DDM , harness side as follows:

Inoperative Door Lock Actuator Connector-Pin	DDM Connector-Pin	Circuit
LH front C525-1	C501b-8 C501b-9	163 (RD/OG)
RH front C603-1	C501b-13	118 (PK/OG)
LH rear C704-1	C501b-13	118 (PK/OG)
RH rear C804-1	C501b-13	118 (PK/OG)

N0107386

- Is the resistance less than 5 ohms?

**B6 CHECK FOR CORRECT DDM OPERATION**

- Disconnect all the DDM connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- Is the concern still present?

**Yes**GO to **B6** .**No**

REPAIR the circuit in question for an open. TEST the system for normal operation.

**Yes**

INSTALL a new DDM . REFER to **Section 419-10** . TEST the system for normal operation.

**No**

The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

**Pinpoint Test C: The Door Locks Operate Only One Way**

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

**Normal Operation**

The Driver Door Module (DDM) sends voltage signals to the door lock control switches through the lock and unlock input circuits. When the lock or unlock switch is pressed, the corresponding voltage signal is routed to ground, signaling the DDM to lock or unlock the doors. The door lock control switches have a dedicated ground circuit.

- DTC B1309 (Power Door Lock Circuit Short To Ground) - a continuous and on-demand DTC that sets when the DDM detects a short to ground on the lock input circuit. This DTC may also set if the lock switch is pressed for longer than 2 minutes.
- DTC B1341 (Power Door Unlock Circuit Short To Ground) - a continuous and on-demand DTC that sets when the DDM detects a short to ground on the unlock input circuit. This DTC may also set if the unlock switch is pressed for longer than 2 minutes.

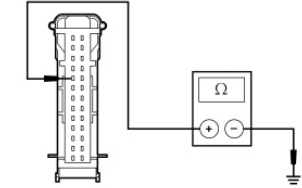

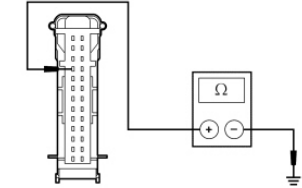

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Door lock control switch
- DDM

**PINPOINT TEST C: THE DOOR LOCKS OPERATE ONLY ONE WAY**

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>C1 CHECK THE RECORDED DDM DTCs FROM THE SELF-TEST</b>	
<ul style="list-style-type: none"> <li>• Check the recorded results from the DDM self-test.</li> <li>• Is DTC B1309 or DTC B1341 present?</li> </ul>	<b>Yes</b> GO to <u>C2</u> .  <b>No</b> GO to <u>C5</u> .
<b>C2 CHECK THE LH DOOR LOCK CONTROL SWITCH</b>	
<ul style="list-style-type: none"> <li>• Disconnect: LH Door Lock Control Switch C505.</li> <li>• Enter the following diagnostic mode on the scan tool: DDM Self-Test.</li> <li>• Is DTC B1309 or DTC B1341 present?</li> </ul>	<b>Yes</b> LEAVE the switch disconnected. GO to <u>C3</u> .  <b>No</b> INSTALL a new LH door lock control switch. REFER to <u>Door Lock Control Switch</u> in this section. TEST the system for normal operation.
<b>C3 CHECK THE RH DOOR LOCK CONTROL SWITCH</b>	
<ul style="list-style-type: none"> <li>• Disconnect: RH Door Lock Control Switch C605.</li> </ul>	<b>Yes</b> LEAVE the switch disconnected.

<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: DDM Self-Test.</li> <li>• <b>Is DTC B1309 or DTC B1341 present?</b></li> </ul>	<p>GO to <u>C4</u> .</p> <p><b>No</b> INSTALL a new RH door lock control switch. REFER to <u>Door Lock Control Switch</u> in this section. TEST the system for normal operation.</p>
<b>C4 CHECK THE LOCK INPUT CIRCUIT OR UNLOCK INPUT CIRCUIT FOR A SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: DDM C501a.</li> <li>• Ignition ON.</li> <li>• For DTC B1309, measure the resistance between the DDM C501a-9, circuit 119 (PK/YE), harness side and ground.</li> </ul>  <p>N0085746</p> <ul style="list-style-type: none"> <li>• For DTC B1341, measure the resistance between the DDM C501a-10, circuit 120 (PK/LG), harness side and ground.</li> </ul>  <p>N0085747</p> <ul style="list-style-type: none"> <li>• <b>Is the resistance greater than 10,000 ohms?</b></li> </ul>	<p><b>Yes</b> GO to <u>C8</u> .</p> <p><b>No</b> REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.</p>
<b>C5 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Press the lock and unlock button of both door lock control switches while observing the door lock operation.</li> <li>• <b>Do the door locks operate only one way from both switches?</b></li> </ul>	<p><b>Yes</b> GO to <u>C7</u> .</p> <p><b>No</b> GO to <u>C6</u> .</p>
<b>C6 CHECK THE LOCK INPUT OR UNLOCK INPUT CIRCUIT FOR AN OPEN (SINGLE SWITCH INOPERATIVE)</b>	

- Disconnect: Suspect Door Lock Control Switch.
- Unlock the doors from the working door lock control switch.
- Connect a fused jumper wire between the LH door lock control switch C505-1, circuit 119 (PK/YE), harness side and the LH door lock control switch C505-4, circuit 57 (BK), harness side; or between the RH door lock control switch C605-1, circuit 119 (PK/YE), harness side and the RH door lock control switch C605-4, circuit 57 (BK), harness side.

N0058784

- Remove the jumper wire.
- Connect a fused jumper wire between the LH door lock control switch C505-3, circuit 120 (PK/LG), harness side and the LH door lock control switch C505-4, circuit 57 (BK), harness side; or between the RH door lock control switch C605-3, circuit 120 (PK/LG), harness side and the RH door lock control switch C605-4, circuit 57 (BK), harness side.

N0058803

- **Do the doors lock and unlock with the jumper wire?**

#### **C7 CHECK THE LOCK INPUT OR UNLOCK INPUT CIRCUIT FOR AN OPEN (BOTH SWITCHES INOPERATIVE)**

- Disconnect: LH Door Lock Control Switch C505.
- Disconnect: DDM C501a.
- If the doors do not lock, measure the resistance between the DDM C501a-9, circuit 119 (PK/YE), harness side and the LH door lock control switch C505-1, circuit 119 (PK/YE), harness side.

N0085748

#### **Yes**

REMOVE the jumper wire. INSTALL a new door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.

#### **No**

REMOVE the jumper wire. REPAIR the input circuit in question. TEST the system for normal operation.

#### **Yes**

GO to C8.

#### **No**

REPAIR the circuit in question. TEST the system for normal operation.

- If the doors do not unlock, measure the resistance between the DDM C501a-10, circuit 120 (PK/LG), harness side and the LH door lock control switch C505-3, circuit 120 (PK/LG), harness side.

N0085749

- **Is the resistance less than 5 ohms?**

#### C8 CHECK FOR CORRECT DDM OPERATION

- Disconnect all the DDM connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

#### Yes

INSTALL a new DDM . REFER to Section 419-10 . TEST the system for normal operation.

#### No

The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

### Pinpoint Test D: All Door Locks Are Inoperative From One Switch

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

#### Normal Operation

The Driver Door Module (DDM) sends voltage signals to the door lock control switches through the lock and unlock input circuits. When the lock or unlock switch is pressed, the corresponding voltage signal is routed to ground, signaling the DDM to lock or unlock the doors. The door lock control switches have a dedicated ground circuit.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Door lock control switch

#### PINPOINT TEST D: ALL DOOR LOCKS ARE INOPERATIVE FROM ONE SWITCH

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take

<b>D1 CHECK THE SUSPECT DOOR LOCK CONTROL SWITCH FOR CORRECT OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect: Suspect Door Lock Control Switch.</li> <li>• Carry out the door lock control switch component test.</li> </ul> <p>Refer to Wiring Diagrams Cell <u>149</u> for component testing.</p> <ul style="list-style-type: none"> <li>• <b>Is the door lock control switch OK?</b></li> </ul>	<p><b>Yes</b> REPAIR circuit 57 (BK) for an open. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new door lock control switch. REFER to <u>Door Lock Control Switch</u> in this section. TEST the system for normal operation.</p>

### **Pinpoint Test E: The Luggage Compartment Lid Release Is Inoperative/Does Not Operate Correctly - Without Police Package**

Refer to Wiring Diagrams Cell 113 , Luggage Compartment for schematic and connector information.

#### **Normal Operation**

When the Driver Door Module (DDM) receives an open request from the luggage compartment lid release switch, a Remote Keyless Entry (RKE) transmitter or the keyless entry keypad (if equipped), the DDM supplies voltage to the luggage compartment lid latch which releases the latch. The luggage compartment lid latch has a dedicated ground circuit.

The luggage compartment lid release switch is supplied voltage at all times through the Central Junction Box (CJB) fuse 2 (7.5A). When the switch is pressed, the voltage is supplied to the DDM , signaling it to release the luggage compartment lid.

- DTC B1553 (Decklid Release Circuit Short To Battery) - a continuous and on-demand DTC that sets when the DDM detects a short to voltage on the luggage compartment lid release switch input circuit. The DTC is also set if the luggage compartment lid release switch is pressed for longer than 2 minutes.
- DTC B2718 (Liftgate/Decklid Ajar Output Short to Battery) - a continuous and on-demand DTC that sets when the DDM detects a short to voltage on the luggage compartment lid release output circuit.

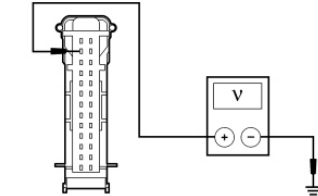

#### **This pinpoint test is intended to diagnose the following:**

- Fuse
- Wiring, terminals or connectors
- Luggage compartment lid release solenoid (part of the luggage compartment lid latch)
- Luggage compartment lid release switch
- DDM

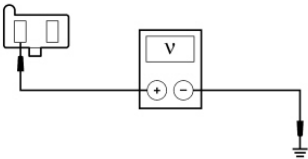

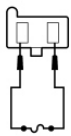

### **PINPOINT TEST E: THE LUGGAGE COMPARTMENT LID RELEASE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - WITHOUT POLICE PACKAGE**

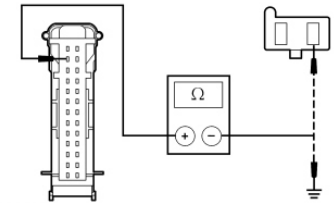

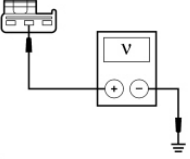

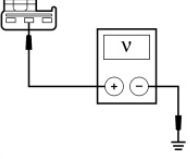

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

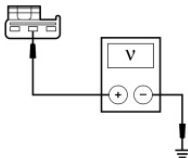

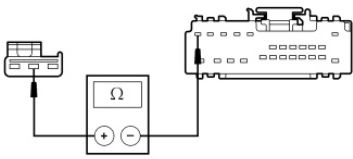

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

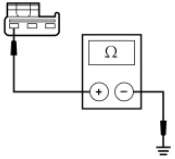

Test Step	Result / Action to Take
<b>E1 CHECK THE DOOR LOCK OPERATION</b>	
<ul style="list-style-type: none"> <li>Lock and unlock the doors using a door lock control switch.</li> <li><b>Do the door locks operate correctly?</b></li> </ul>	<p><b>Yes</b> GO to <u>E2</u> .</p> <p><b>No</b> GO to <u>Pinpoint Test A</u> .</p>
<b>E2 RETRIEVE THE RECORDED DDM DTCs FROM THE SELF-TEST</b>	
<ul style="list-style-type: none"> <li>Check for recorded DDM DTCs from the self-test.</li> <li><b>Are any DTCs recorded?</b></li> </ul>	<p><b>Yes</b> For DTC B1553, GO to <u>E3</u> .  For DTC B2718, GO to <u>E9</u> .  For all other DDM DTCs, REFER to DTC Charts in this section.</p> <p><b>No</b> GO to <u>E5</u> .</p>
<b>E3 RERUN THE DDM SELF-TEST</b>	
<ul style="list-style-type: none"> <li>Ignition ON.</li> <li>Disconnect: Luggage Compartment Lid Release Switch C534.</li> <li>Clear the DTCs, then rerun the DDM self-test.</li> <li><b>Is DTC B1553 present?</b></li> </ul>	<p><b>Yes</b> GO to <u>E4</u> .</p> <p><b>No</b> INSTALL a new luggage compartment lid release switch. TEST the system for normal operation.</p>
<b>E4 CHECK THE LUGGAGE COMPARTMENT LID RELEASE INPUT CIRCUIT FOR A SHORT TO VOLTAGE</b>	
<ul style="list-style-type: none"> <li>Ignition OFF.</li> <li>Disconnect: DDM C501a.</li> <li>Ignition ON.</li> <li>Measure the voltage between the DDM C501a-12, circuit 26 (WH/VT), harness side and ground.</li> </ul>  <p>N0027096</p> <ul style="list-style-type: none"> <li><b>Is any voltage present?</b></li> </ul>	<p><b>Yes</b> REPAIR circuit 26 (WH/VT) for a short to voltage.  <p>N0079447</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	the system for normal operation.
<b>E14 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <a href="#">Section 419-10</a> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

### Pinpoint Test F: The Luggage Compartment Lid Release Is Inoperative/Does Not Operate Correctly-With Police Package

Refer to Wiring Diagrams Cell [113](#) , Luggage Compartment for schematic and connector information.

#### Normal Operation

Vehicles equipped with the police package have 2 luggage compartment lid release switches, one located on the instrument panel and one located on the LH door trim panel. The instrument panel switch is supplied voltage through 1 of the 2 circuits. One of the circuits is only supplied voltage any time the accessory delay relay is active and the other has voltage at all times. When the luggage compartment lid release switch is pressed, the switch closes and supplies voltage to the luggage compartment lid latch releasing the luggage compartment lid. The luggage compartment lid latch has a dedicated ground circuit.

#### This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Luggage compartment lid release solenoid (part of the luggage compartment lid latch)
- Luggage compartment lid release switch

### PINPOINT TEST F: THE LUGGAGE COMPARTMENT LID RELEASE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - WITH POLICE PACKAGE

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to [Section 414-01](#) .

Test Step	Result / Action to Take
-----------	-------------------------

**F1 CHECK FOR VOLTAGE TO THE INOPERATIVE LUGGAGE COMPARTMENT LID RELEASE SWITCH**

- Disconnect: Suspect Luggage Compartment Lid Release Switch.
- Ignition ON.
- Measure the voltage between the luggage compartment lid release switch, harness side and ground as follows:

Suspect Switch	Connector-Pin	Circuit
Driver door	C534-1	193 (YE/LG)
Instrument panel (voltage at all times)	C2203-2	517 (BK/WH)
Instrument panel (voltage in RUN/ACC)	C2204-2	193 (YE/LG)

N0107387

- Is the voltage greater than 10 volts?

**Yes**  
GO to **F2** .

**No**  
REPAIR the circuit in question for an open. TEST the system for normal operation.

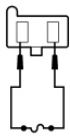

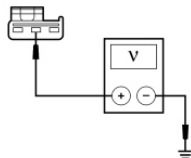

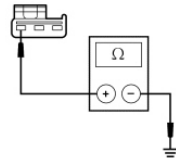

**F2 CHECK THE LUGGAGE COMPARTMENT LID RELEASE SWITCH FOR CORRECT OPERATION**

- **NOTE:** If the fuse in the jumper wire fails, repair circuit 84 (VT/YE) for a short to ground.
- Connect a fused jumper wire between the luggage compartment lid release switch terminals, harness side as follows:

Suspect Switch	Connector-Pin/ Circuit	Connector-Pin/ Circuit
Driver door	C534-1 193 (YE/LG)	C534-2 84 (VT/YE)
Instrument panel (voltage	C2203-2	C2203-1

**Yes**  
INSTALL a new luggage compartment lid release switch. TEST the system for normal operation.

**No**  
LEAVE the jumper wire connected. GO to **F3** .

<table border="1"> <tr> <td>at all times)</td><td>517 (BK/WH)</td><td>84 (VT/YE)</td></tr> <tr> <td>Instrument panel (voltage in RUN/ACC)</td><td>C2204-2 193 (YE/LG)</td><td>C2204-1 84 (VT/YE)</td></tr> </table>	at all times)	517 (BK/WH)	84 (VT/YE)	Instrument panel (voltage in RUN/ACC)	C2204-2 193 (YE/LG)	C2204-1 84 (VT/YE)

REFER to <u>Luggage Compartment Lid Latch</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> REPAIR circuit 57 (BK) for an open. TEST the system for normal operation.</p>						
 <p>N0079447</p>								
<ul style="list-style-type: none"> <li>Is the resistance less than 5 ohms?</li> </ul>								

**Pinpoint Test G: The Doors Do Not Lock/Unlock Using The Keyless Entry Keypad**

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

**Normal Operation**

The Driver Door Module (DDM) monitors for a ground signal on the keyless entry keypad signal input circuits. When an individual keypad button is touched, an individual or combination of the input circuits is routed to ground. The DDM then determines which button was touched based on which circuit(s) are grounded. The keypad has a dedicated ground circuit. Once the DDM determines that the 5-digit personal entry code, or the factory set 5-digit entry code has been entered on the keypad, the DDM then unlocks the driver door.

To unlock all the doors, the 3/4 button must be pressed within 5 seconds of the 5-digit code being entered.

To release the luggage compartment lid, the 5/6 button must be pressed within 5 seconds of the 5-digit code being entered.

To lock all the doors, the 5-digit code does not need to be entered. Press the 7/8 and 9/0 buttons at the same time.

The keyless entry keypad has an anti-scan feature to help prevent theft. If a valid 5-digit code is not entered within 7 attempts (35 consecutive button presses), the keyless entry keypad will go into anti-scan. In anti-scan mode, the keypad illumination will flash and all input will be ignored except for pressing the 7/8 and 9/0 buttons, which will lock all doors.

- DTC B2695 (Keypad\_A Switch Circuit Failure) - a continuous and on-demand DTC that sets when the DDM detects a short to ground on the keypad input circuit. This DTC may also set if any keyless entry keypad button is pressed for longer than 2 minutes.
- DTC B2696 (Keypad\_B Switch Circuit Failure) - a continuous and on-demand DTC that sets when the DDM detects a short to ground on the keypad input circuit. This DTC may also set if any keyless entry keypad button is pressed for longer than 2 minutes.
- DTC B2697 (Keypad\_C Switch Circuit Failure) - a continuous and on-demand DTC that sets when the DDM detects a short to ground on the keypad input circuit. This DTC may also set if any keyless entry keypad button is pressed for longer than 2 minutes.

**This pinpoint test is intended to diagnose the following:**

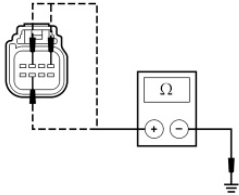

- Wiring, terminals or connectors
- Keyless entry keypad
- DDM

**PINPOINT TEST G: THE DOORS DO NOT LOCK/UNLOCK USING THE KEYLESS ENTRY KEYPAD**

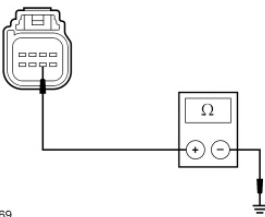

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take

<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>		<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

### Pinpoint Test H: The Keyless Entry Keypad Illumination Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

#### Normal Operation

The keyless entry keypad illumination is supplied voltage at all times from the Central Junction Box (CJB) Fuse 2 (7.5A). When the Driver Door Module (DDM) detects a keyless entry keypad button is pressed, the DDM supplies ground to the keyless entry keypad illumination.

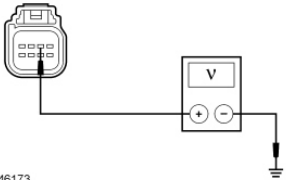

**This pinpoint test is intended to diagnose the following:**

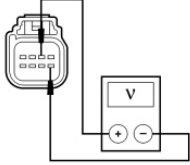

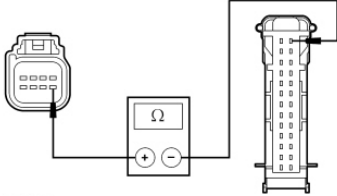

- Fuse
- Wiring, terminals or connectors
- Keyless entry keypad
- DDM

### PINPOINT TEST H: THE KEYLESS ENTRY KEYPAD ILLUMINATION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>H1 CHECK THE KEYLESS ENTRY KEYPAD</b>	

<ul style="list-style-type: none"> <li>Observe the door locks while pressing the keyless entry keypad 7/8 and 9/0 buttons.</li> <li><b>Do the doors lock?</b></li> </ul>	<p><b>Yes</b> GO to <u>H2</u> .</p> <p><b>No</b> GO to Pinpoint Test G .</p>
<b>H2 CHECK THE KEYLESS ENTRY KEYPAD ILLUMINATION</b>	
<ul style="list-style-type: none"> <li>Observe the keyless entry keypad illumination.</li> <li><b>Is the keyless entry keypad illumination always on?</b></li> </ul>	<p><b>Yes</b> GO to <u>H3</u> .</p> <p><b>No</b> GO to <u>H4</u> .</p>
<b>H3 CHECK THE KEYLESS ENTRY KEYPAD ILLUMINATION CIRCUIT FOR A SHORT TO GROUND</b>	
<ul style="list-style-type: none"> <li>Ignition OFF.</li> <li>Disconnect: DDM C501a.</li> <li>Observe the keyless entry keypad illumination.</li> <li><b>Is the keyless entry keypad illumination on?</b></li> </ul>	<p><b>Yes</b> REPAIR circuit 66 (LB) for a short to ground. TEST the system for normal operation.</p> <p><b>No</b> GO to <u>H7</u> .</p>
<b>H4 CHECK FOR VOLTAGE TO THE KEYPAD</b>	
<ul style="list-style-type: none"> <li>Disconnect: Keyless Entry Keypad C530.</li> <li>Measure the voltage between the keyless entry keypad C530-2, circuit 1523 (DG), harness side and ground.</li> </ul>  <p>A0046173</p> <ul style="list-style-type: none"> <li><b>Is the voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <u>H5</u> .</p> <p><b>No</b> REPAIR circuit 1523 (DG) for an open. TEST the system for normal operation.</p>
<b>H5 CHECK FOR DDM OUTPUT</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: DDM DataLogger.</li> <li>Active command the DDM keypad illumination PID (LIGHT) on.</li> <li>Measure the voltage between the keyless entry keypad C530-2, circuit 1523 (DG), harness side, and the keyless entry keypad C530-5, circuit 66 (LB), harness side.</li> </ul>	<p><b>Yes</b> INSTALL a new keyless entry keypad. REFER to <u>Keyless Entry Keypad</u> in this section.</p> <p><b>No</b> GO to <u>H6</u> .</p>

 <p>N0079451</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	
<b>H6 CHECK THE KEYLESS ENTRY KEYPAD ILLUMINATION CIRCUIT FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: DDM C501a.</li> <li>• Measure the resistance between the keyless entry keypad C530-5, circuit 66 (LB), harness side and the DDM C501a-26, circuit 66 (LB), harness side.</li> </ul>  <p>N0027111</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p><b>Yes</b> GO to <u>H7</u> .</p> <p><b>No</b> REPAIR circuit 66 (LB) for an open. TEST the system for normal operation.</p>
<b>H7 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>♦ corrosion</li> <li>♦ damaged pins</li> <li>♦ pushed-out pins</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

### Pinpoint Test I: The Remote Keyless Entry (RKE) Transmitter Is Inoperative

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

#### Normal Operation

Remote locking and unlocking of the doors, releasing the luggage compartment lid, and activation of the panic alarm is accomplished by the Driver Door Module (DDM) receiving a command message from the Remote Keyless Entry (RKE) transmitter. The DDM processes the command and energizes the appropriate relays to lock or unlock the doors, release the luggage compartment lid, or sends a message over the Standard Corporate Protocol (SCP) network to the Lighting Control Module (LCM) to activate the parking lamps and horn for the panic alarm.

The RKE transmitters and DDM also utilize a rolling code to prevent the code from being "captured" by a code grabber. The system advances the counter in the RKE transmitter and DDM every time an RKE transmitter button is pressed.

DTC Description	Fault Trigger Conditions
• B1148 - Radio Frequency Power Output Circuit Short to Ground	A continuous DTC that sets when the DDM detects the radio frequency power output circuit is shorted to ground.
• B1149 - Radio Frequency Enable Output Circuit Short to Battery	A continuous DTC that sets when the DDM detects the radio frequency enable output circuit is shorted to voltage.
• B1150 - Radio Frequency Enable Output Circuit Short to Ground	A continuous DTC that sets when the DDM detects the radio frequency enable output circuit is shorted to ground.
• B1151 - Radio Frequency AM/FM Signal Key Select Output Circuit Short to Ground	A continuous DTC that sets when the DDM detects the radio frequency AM/FM signal key select output circuit is shorted to ground.
• B1152 - Radio Frequency AM/FM Signal Key Select Output Circuit Short to Battery	A continuous DTC that sets when the DDM detects the radio frequency AM/FM signal key select output circuit is shorted to voltage.
• B2425 - Remote Keyless Entry Out of Synchronization	A continuous DTC that sets when the DDM detects the rolling counter received from an RKE transmitter is 1,024 times greater than the rolling counter stored in the module.

**This pinpoint test is intended to diagnose the following:**

- RKE transmitter battery
- RKE transmitter button pressed a substantial amount of times while outside the range of the vehicle
- RKE transmitter programming
- RKE transmitter
- Tire Pressure Monitoring System (TPMS)/ RKE antenna
- DDM

#### **PINPOINT TEST I: THE RKE TRANSMITTER IS INOPERATIVE**

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

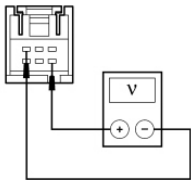

**NOTE:** Aftermarket or dealer-installed systems may adversely affect the RKE system operation. These systems should be disconnected before diagnosing any RKE concerns.

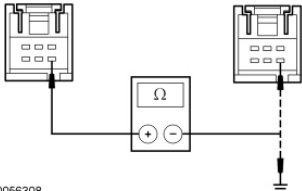

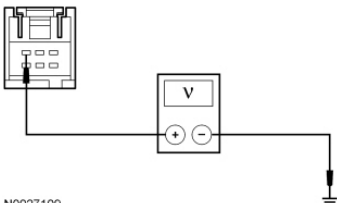

Test Step	Result / Action to Take
-----------	-------------------------

<b>I1 CHECK FOR THE CORRECT RKE TRANSMITTERS</b>	
<ul style="list-style-type: none"> <li>• <b>NOTE:</b> Make sure the RKE transmitters are those provided with the OEM system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle.</li> <li>• Check that the correct RKE transmitters are used with the vehicle. Compare the RKE transmitters with the one shown in <u>Handles, Locks, Latches and Entry Systems</u> in the Description and Operation portion of this section.</li> <li>• <b>Are the correct RKE transmitters present?</b></li> </ul>	<p><b>Yes</b> GO to <u>I2</u> .</p> <p><b>No</b> The system cannot be tested without the correct RKE transmitters. <b>INFORM</b> the customer that the correct RKE transmitters must be present to proceed with diagnosis of the system.</p>
<b>I2 CHECK THE FUNCTIONALITY OF ALL RKE TRANSMITTERS</b>	
<ul style="list-style-type: none"> <li>• Press each button on a transmitter.</li> <li>• <b>Do any buttons operate correctly?</b></li> </ul>	<p><b>Yes</b> GO to <u>Pinpoint Test J</u> .</p> <p><b>No</b> GO to <u>I3</u> .</p>
<b>I3 RETRIEVE THE RECORDED DDM DTCs FROM THE SELF-TEST</b>	
<ul style="list-style-type: none"> <li>• Check the recorded results from the DDM self-test.</li> <li>• <b>Is continuous DTC B1148, DTC B1149, DTC B1150, DTC B1151, DTC B1152, or DTC B2425 present?</b></li> </ul>	<p><b>Yes</b> For DTC B2425, GO to <u>I4</u> .</p> <p>For DTC B1148, DTC B1149, DTC B1150, DTC B1151 or DTC B1152, GO to <u>I12</u> .</p> <p><b>No</b> GO to <u>I8</u> .</p>
<b>I4 RESYNCHRONIZE THE INOPERATIVE RKE TRANSMITTER</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Press any button on the inoperative RKE transmitter 4 times consecutively within 30 seconds.</li> <li>• <b>Does the RKE transmitter operate correctly now?</b></li> </ul>	<p><b>Yes</b> The transmitter is now synchronized. <b>CLEAR</b> the DTCs. <b>REPEAT</b> the self-test.</p> <p><b>No</b> GO to <u>I5</u> .</p>
<b>I5 CHECK FOR A SECOND RKE TRANSMITTER</b>	
<ul style="list-style-type: none"> <li>• Check for another RKE transmitter that operates with the vehicle.</li> <li>• <b>Is there another RKE transmitter that operates with the vehicle?</b></li> </ul>	<p><b>Yes</b> GO to <u>I6</u> .</p> <p><b>No</b> GO to <u>I7</u> .</p>
<b>I6 RESYNCHRONIZE THE INOPERATIVE RKE TRANSMITTER USING THE SECOND RKE TRANSMITTER</b>	
<ul style="list-style-type: none"> <li>• Press any button on the operational RKE transmitter.</li> </ul>	<p><b>Yes</b> The RKE transmitter is now synchronized. <b>CLEAR</b> the DTCs. <b>REPEAT</b> the self-test.</p>

<ul style="list-style-type: none"> <li>• Within 30 seconds, press a button on the inoperative RKE transmitter.</li> <li>• Check the inoperative RKE transmitter for correct operation.</li> <li>• <b>Does the inoperative RKE transmitter operate now?</b></li> </ul>	<b>No</b> GO to <u>I7</u> .
<b>I7 PROGRAM THE INOPERATIVE RKE TRANSMITTER OR ALL THE RKE TRANSMITTERS</b>	
<ul style="list-style-type: none"> <li>• Program the inoperative RKE transmitter individually using a scan tool or program all RKE transmitters using the manual key cycle method. Refer to <u>Remote Keyless Entry (RKE) Transmitter Programming</u> in this section.</li> <li>• <b>Does the inoperative RKE transmitter(s) operate now?</b></li> </ul>	<b>Yes</b> The RKE transmitter(s) is now synchronized. INFORM the customer that any RKE transmitters not present need to be programmed. CLEAR the DTCs. REPEAT the self-test.  <b>No</b> GO to <u>I8</u> .
<b>I8 MAKE SURE THE RKE TRANSMITTER SIGNAL IS BEING RECEIVED</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Remote Keyless Entry.</li> <li>• <b>NOTE:</b> The remote keyless entry test is accessed through the scan tool by selecting Toolbox, Body, Security.</li> <li>• Monitor the RKE Transmitter Identification Code (TIC) through the scan tool menus.</li> <li>• Verify the RKE transmitter signal is being received. Press a button on the RKE transmitter while observing the scan tool.</li> <li>• <b>Does the TIC show up on the scan tool screen when a button is pressed?</b></li> </ul>	<b>Yes</b> GO to <u>I9</u> .  <b>No</b> GO to <u>I10</u> .
<b>I9 CHECK IF THE RKE TRANSMITTERS ARE PROGRAMMED</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Remote Keyless Entry.</li> <li>• Monitor the RKE transmitter TIC data through the scan tool menus.</li> <li>• Press a button on the RKE transmitter while observing the scan tool.</li> <li>• <b>Does the TIC displayed after pressing a button on the RKE transmitter match any of the TICs stored in memory?</b></li> </ul>	<b>Yes</b> GO to <u>I20</u> .  <b>No</b> PROGRAM the inoperative RKE transmitter individually using a scan tool or PROGRAM all the RKE transmitters using the manual key cycle method. REFER to <u>Remote Keyless Entry (RKE) Transmitter Programming</u> in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation.
<b>I10 CHECK FOR NORMAL OPERATION WITH A KNOWN GOOD RKE TRANSMITTER</b>	
	<b>Yes</b> GO to <u>I11</u> .

<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Remote Keyless Entry.</li> <li>• Monitor the RKE transmitter TIC data through the scan tool menus.</li> <li>• Using the customer's second RKE transmitter or a known good RKE transmitter that is correct for the vehicle (and programmed to the vehicle), verify the RKE transmitter signal is being received.</li> <li>• <b>Does the TIC show up on the scan tool when a button is pressed on the RKE transmitter?</b></li> </ul>	<p><b>No</b> GO to <a href="#">I12</a> .</p>
<p><b>I11 CHECK THE INOPERATIVE RKE TRANSMITTER BATTERY</b></p>	
<ul style="list-style-type: none"> <li>• Using a thin coin, open the inoperative RKE transmitter.</li> <li>• Do not clean off any grease from the battery terminals on the back surface of the circuit board.</li> <li>• Verify the correct battery is used (CR2032).</li> <li>• Remove the RKE transmitter battery and measure the voltage.</li> <li>• <b>Is the voltage greater than 2.5 volts?</b></li> </ul>	<p><b>Yes</b> REPLACE the inoperative RKE transmitter. PROGRAM the inoperative RKE transmitter individually using a scan tool or PROGRAM all RKE transmitters using the manual key cycle method. REFER to <a href="#">Remote Keyless Entry (RKE) Transmitter Programming</a> in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new battery. DO NOT reprogram the RKE transmitters (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.</p>
<p><b>I12 CHECK FOR VOLTAGE TO THE TPMS / RKE ANTENNA</b></p>	
<ul style="list-style-type: none"> <li>• Disconnect: TPMS / RKE Antenna C3183.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between the TPMS / RKE antenna C3183-4, circuit 2308 (RD/WH), harness side and the TPMS / RKE antenna C3183-3, circuit 2307 (BK/WH), harness side.</li> </ul>  <p style="text-align: center;">N10079452</p> <ul style="list-style-type: none"> <li>• <b>Is the voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <a href="#">I16</a> .</p> <p><b>No</b> GO to <a href="#">I13</a> .</p>
<p><b>I13 CHECK THE TPMS / RKE ANTENNA VOLTAGE CIRCUIT FOR AN OPEN OR SHORT TO GROUND</b></p>	

<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: DDM C501c.</li> <li>• Measure the resistance between the TPMS / RKE antenna C3183-4, circuit 2308 (RD/WH), harness side and the DDM C501c-4, circuit 2308 (RD/WH), harness side; and between the TPMS / RKE antenna C3183-4, circuit 2308 (RD/WH), harness side and ground.</li> </ul>  <p>N0056308</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 5 ohms between the TPMS / RKE antenna and the DDM , and greater than 10,000 ohms between the TPMS / RKE antenna and ground?</li> </ul>	<p><b>Yes</b> GO to <u>I14</u> .</p> <p><b>No</b> REPAIR circuit 2308 (RD/WH) for an open or short to ground. TEST the system for normal operation.</p>
<b>I14 CHECK THE TPMS / RKE ANTENNA GROUND CIRCUIT FOR A SHORT TO VOLTAGE</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Measure the voltage between the TPMS / RKE antenna C3183-3, circuit 2307 (BK/WH), harness side and ground.</li> </ul>  <p>N0027109</p> <ul style="list-style-type: none"> <li>• Is any voltage present?</li> </ul>	<p><b>Yes</b> REPAIR circuit 2307 (BK/WH) for a short to voltage. TEST the system for normal operation.</p> <p><b>No</b> GO to <u>I15</u> .</p>
<b>I15 CHECK THE TPMS / RKE ANTENNA GROUND CIRCUIT FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Measure the resistance between the TPMS / RKE antenna C3183-3, circuit 2307 (BK/WH), harness side and the DDM C501c-3, circuit 2307 (BK/WH), harness side.</li> </ul>	<p><b>Yes</b> GO to <u>I20</u> .</p> <p><b>No</b> REPAIR circuit 2307 (BK/WH) for an open. TEST the system for normal operation.</p>

- Is the resistance less than 5 ohms?

# **I16 CHECK THE TPMS / RKE ANTENNA COMMUNICATION CIRCUITS FOR A SHORT TO VOLTAGE**

- Ignition OFF.
- Disconnect: DDM C501c.
- Ignition ON.
- Measure the voltage between the TPMS / RKE antenna connector, harness side and ground as follows.

Connector-Pin	Circuit
C3183-1	2305 (VT/LB)
C3183-2	2306 (GY/RD)
C3183-5	2309 (LB/BK)

- Is any voltage present?

# **I17 CHECK THE TPMS / RKE ANTENNA COMMUNICATION CIRCUITS FOR AN OPEN**

- Measure the resistance between the TPMS / RKE antenna connector, harness side and the DDM connector, harness side as follows.

TPMS / RKE Antenna Connector-Pin	DDM Connector-Pin	Circuit
C3183-1	C501c-1	2305 (VT/LB)
C3183-2	C501c-2	

**Yes**

REPAIR the circuit in question. TEST the system for normal operation.

**No**

GO to **I17** .

**Yes**

GO to **I18** .

**No**

REPAIR the circuit in question. TEST the system for normal operation.

### Pinpoint Test J: An Individual Button/Feature Is Inoperative From The Remote Keyless Entry (RKE) Transmitter

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

#### Normal Operation

Remote locking and unlocking of the doors, releasing the luggage compartment lid, and activation of the panic alarm is accomplished by the Driver Door Module (DDM) receiving a command message from the Remote Keyless Entry (RKE) transmitter. The DDM processes the command and energizes the appropriate relays to lock or unlock the doors, releases the luggage compartment lid, or sends a message over the Standard Corporate Protocol (SCP) network to the Lighting Control Module (LCM) to activate the parking lamps and horn for the panic alarm.

The LCM will disable the PANIC feature if the ignition key is in any position other than OFF or LOCK.

#### This pinpoint test is intended to diagnose the following:

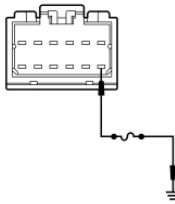

- Wiring, terminals or connectors
- Door locks
- Horn system
- Luggage compartment lid release
- Parking lamps
- RKE transmitter
- LCM
- DDM

#### PINPOINT TEST J: AN INDIVIDUAL BUTTON/FEATURE IS INOPERATIVE FROM THE RKE TRANSMITTER

**NOTICE:** Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>J1 CHECK THE COMPLETE FUNCTIONALITY OF THE RKE TRANSMITTER</b>	
<ul style="list-style-type: none"> <li>• Press each button on the transmitter.</li> </ul>	<p><b>Yes</b> <u>GO to Pinpoint Test I</u> .</p> <p><b>No</b></p>

<ul style="list-style-type: none"> <li>• Is the RKE transmitter completely inoperative?</li> </ul>	GO to <u>J2</u> .
<b>J2 CHECK THE PANIC FEATURE FROM THE RKE TRANSMITTER</b>	
<ul style="list-style-type: none"> <li>• Press the panic button on the RKE transmitter.</li> <li>• Is PANIC the inoperative button?</li> </ul>	<b>Yes</b> GO to <u>J5</u> .  <b>No</b> GO to <u>J3</u> .
<b>J3 CHECK THE DOOR LOCK OPERATION</b>	
<ul style="list-style-type: none"> <li>• Press the lock and unlock buttons on the interior door lock control switch.</li> <li>• Do the doors lock and unlock?</li> </ul>	<b>Yes</b> GO to <u>J4</u> .  <b>No</b> GO to <u>Symptom Chart - Electrical</u> .
<b>J4 CHECK THE LUGGAGE COMPARTMENT LID RELEASE OPERATION</b>	
<ul style="list-style-type: none"> <li>• Press the luggage compartment lid release switch on the driver door panel.</li> <li>• Does the luggage compartment lid release?</li> </ul>	<b>Yes</b> REPLACE the inoperative RKE transmitter. PROGRAM the inoperative RKE transmitter individually using a scan tool or PROGRAM all RKE transmitters using the manual key cycle method. REFER to <u>Remote Keyless Entry (RKE) Transmitter Programming</u> in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation.  <b>No</b> GO to <u>Pinpoint Test E</u> .
<b>J5 CHECK THE PANIC ALARM</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>NOTE:</b> Make sure the key is in the OFF position. The panic alarm will not operate with the key in any other position.</li> <li>• Press the panic button on the RKE transmitter.</li> <li>• Does the panic alarm operate?</li> </ul>	<b>Yes</b> The system is working normally. INFORM the customer of the correct operation of the panic alarm.  <b>No</b> GO to <u>J6</u> .
<b>J6 CHECK THE DDM PID (TNSMT_CMD)</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: DDM DataLogger.</li> <li>• Monitor the DDM PID (TNSMT_CMD) while pressing the PANIC button on the RKE transmitter.</li> <li>• Does the PID indicate PANIC?</li> </ul>	<b>Yes</b> GO to <u>J7</u> .  <b>No</b> REPLACE the inoperative RKE transmitter. PROGRAM the inoperative RKE transmitter individually using a scan tool or PROGRAM all RKE transmitters using the manual key cycle method. REFER to <u>Remote Keyless Entry (RKE) Transmitter Programming</u> in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST

	the system for normal operation.
<b>J7 CHECK THE PARKING LAMP OPERATION</b>	
<ul style="list-style-type: none"> <li>• Turn the headlamp switch to the PARKLAMP position.</li> <li>• <b>Do the parking lamps illuminate?</b></li> </ul>	<p><b>Yes</b> GO to <u>J8</u> .</p> <p><b>No</b> REFER to <u>Section 417-01</u> .</p>
<b>J8 CHECK THE HORN OPERATION</b>	
<ul style="list-style-type: none"> <li>• Press the horn switch.</li> <li>• <b>Does the horn sound?</b></li> </ul>	<p><b>Yes</b> GO to <u>J9</u> .</p> <p><b>No</b> REFER to <u>Section 413-06</u> .</p>
<b>J9 ACTIVE COMMAND THE HORN TO SOUND</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: LCM DataLogger.</li> <li>• Active command the LCM PID (HORN) ON and then OFF.</li> <li>• <b>Does the horn sound when active commanded?</b></li> </ul>	<p><b>Yes</b> GO to <u>J11</u> .</p> <p><b>No</b> GO to <u>J10</u> .</p>
<b>J10 CHECK THE HORN SIGNAL CIRCUIT FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: LCM C2145b.</li> <li>• Connect a fused jumper wire between the LCM C2145b-7, circuit 1 (DB), harness side and ground.</li> </ul>  <p>N0079453</p> <ul style="list-style-type: none"> <li>• <b>Does the horn sound?</b></li> </ul>	<p><b>Yes</b> GO to <u>J12</u> .</p> <p><b>No</b> REPAIR circuit 1 (DB) for an open. TEST the system for normal operation.</p>
<b>J11 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> </ul> </li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b></p>

<ul style="list-style-type: none"> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
<b>J12 CHECK FOR CORRECT LCM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the LCM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the LCM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>	<p><b>Yes</b> INSTALL a new LCM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

### Pinpoint Test K: The Remote Keyless Entry (RKE) Transmitter Has Poor Range Performance

#### Normal Operation

Remote locking and unlocking of the doors, releasing the luggage compartment lid, and activation of the panic alarm is accomplished by the Driver Door Module (DDM) receiving a command message from the Remote Keyless Entry (RKE) transmitter. The DDM processes the command and energizes the appropriate relays to lock or unlock the doors, releases the luggage compartment lid, or sends a message over the Standard Corporate Protocol (SCP) network to the Lighting Control Module (LCM) to activate the parking lamps and horn for the panic alarm. The RKE transmitter has a normal operating range of 10 m (33 ft).

**This pinpoint test is intended to diagnose the following:**

- Aftermarket systems
- High power devices
- TV/radio transmission towers
- RKE transmitter
- RKE transmitter battery
- Tire Pressure Monitoring System (TPMS)/ RKE antenna

#### PINPOINT TEST K: THE RKE TRANSMITTER HAS POOR RANGE PERFORMANCE

Test Step	Result / Action to Take
<b>K1 CHECK FOR THE CORRECT RKE TRANSMITTERS</b>	
	<b>Yes</b>

<p><b>NOTE:</b> Make sure the RKE transmitters are those provided with the OEM system and not from an aftermarket system, or a dealer-installed system, that may have been installed on the vehicle.</p> <ul style="list-style-type: none"> <li>• Check that the correct RKE transmitters are used with the vehicle. Compare the RKE transmitters with the one shown in <u>Handles, Locks, Latches and Entry Systems</u> in the Description and Operation portion of this section.</li> <li>• <b>Are the correct RKE transmitters present?</b></li> </ul>	<p>GO to <u>K2</u> .</p> <p><b>No</b> The system cannot be tested without the correct RKE transmitters. INFORM the customer that the correct RKE transmitters must be present to proceed with diagnosis of the system.</p>
<b>K2 CHECK ALL RKE TRANSMITTERS FOR POOR RANGE PERFORMANCE</b>	
<p><b>NOTE:</b> The 10 m (33 ft) measurement of range is not the standard but is a guideline that clearly indicates a vehicle is experiencing poor range performance.</p> <ul style="list-style-type: none"> <li>• Check all RKE transmitters for poor range performance (less than 10 m [33 ft]).</li> <li>• <b>Do all RKE transmitters experience poor range performance?</b></li> </ul>	<p><b>Yes</b> GO to <u>K4</u> .</p> <p><b>No</b> GO to <u>K3</u> .</p>
<b>K3 CHECK THE BATTERY OF THE RKE TRANSMITTER WITH POOR RANGE</b>	
<ul style="list-style-type: none"> <li>• Using a thin coin, open the inoperative RKE transmitter.</li> <li>• Do not clean off any grease from the battery terminals on the back surface of the circuit board.</li> <li>• Verify the correct battery is used (CR2032).</li> <li>• Remove the RKE transmitter battery and measure the voltage.</li> <li>• <b>Is the voltage greater than 2.5 volts?</b></li> </ul>	<p><b>Yes</b> REPLACE the inoperative RKE transmitter. PROGRAM the inoperative RKE transmitter individually using a scan tool or PROGRAM all RKE transmitters using the manual key cycle method. REFER to <u>Remote Keyless Entry (RKE) Transmitter Programming</u> in this section. INFORM the customer that any RKE transmitters not present need to be programmed. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new battery. DO NOT reprogram the RKE transmitters (weak or dead batteries do not erase Transmitter Identification Codes (TICs) from memory). TEST the system for normal operation.</p>
<b>K4 CHECK THE LOCATION OF THE VEHICLE AND THE APPROACH ANGLES AROUND THE VEHICLE</b>	

<ul style="list-style-type: none"> <li>• Make sure the poor performance is consistent in nature and is not from one approaching angle.</li> <li>• If the vehicle is within 0.8 km (0.5 mile) of high-power devices or radio/TV towers, the operating distance of the RKE transmitters may be reduced.</li> <li>• <b>Is the poor range performance consistent around the vehicle?</b></li> </ul>	<p><b>Yes</b> INSTALL a new TPMS / RKE antenna. REFER to <u>Antenna</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. TEST the system for normal operation.</p>
---	---

### Pinpoint Test L: The Autolock Does Not Operate Correctly

#### Normal Operation

The autolocking function automatically locks all doors when all of the following conditions are concurrently met during the current key cycle:

- All the doors are closed
- The autolocking function is active
- The ignition switch is in the RUN position
- The transmission is in a forward gear
- The vehicle speed exceeds 5 km/h (3 mph)

After the initial activation of autolocking and at least one door has been opened, autolocking is activated again if the following conditions are concurrently met:

- All the doors are closed
- The ignition switch is in the RUN position
- The transmission is in a forward gear
- The vehicle speed exceeds 5 km/h (3 mph)

The Driver Door Module (DDM) receives inputs from the ignition switch position, digital Transmission Range (TR) sensor, and the vehicle speed over the Standard Corporate Protocol (SCP) network. If the DDM does not receive or receives invalid data for vehicle speed from the Instrument Cluster (IC), it sets DTC U1041. If the DDM does not receive or receives invalid data for the TR sensor from the IC, it sets DTC U1059. The DDM also receives input from the door ajar switches, which are hardwired to the DDM.

**This pinpoint test is intended to diagnose the following:**

- Door ajar switch input
- Vehicle speed signal message from the IC
- Digital TR sensor message from the IC
- DDM

#### PINPOINT TEST L: THE AUTOLOCK DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
<b>L1 VERIFY THE AUTOLOCK FEATURE IS ENABLED</b>	

<ul style="list-style-type: none"> <li>• Verify the autolock feature is enabled. Refer to <u>Autolock and Auto-Unlock Programming</u> in this section.</li> <li>• <b>Is the autolock feature enabled?</b></li> </ul>	<p><b>Yes</b> GO to <u>L2</u> .</p> <p><b>No</b> ENABLE the autolock feature. REFER to <u>Autolock and Auto-Unlock Programming</u> in this section.</p>
<b>L2 CHECK THE COURTESY LAMP OPERATION</b>	
<ul style="list-style-type: none"> <li>• Open and close the doors while observing the courtesy lamp operation.</li> <li>• <b>Do the courtesy lamps operate correctly?</b></li> </ul>	<p><b>Yes</b> GO to <u>L3</u> .</p> <p><b>No</b> REFER to <u>Section 417-02</u> .</p>
<b>L3 RETRIEVE THE RECORDED DDM DTCs FROM THE SELF-TEST</b>	
<ul style="list-style-type: none"> <li>• Check the recorded results from the DDM self-test.</li> <li>• <b>Is continuous DTC U1041 or DTC U1059 retrieved?</b></li> </ul>	<p><b>Yes</b> For DTC U1041, REFER to <u>Section 413-01</u> to diagnose the speedometer.</p> <p>For DTC U1059, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the digital TR sensor.</p> <p>For all other DDM DTCs, REFER to DTC Charts.</p> <p><b>No</b> GO to <u>L4</u> .</p>
<b>L4 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

**Pinpoint Test M: The Auto-Unlock Does Not Operate Correctly****Normal Operation**

The Driver Door Module (DDM) energizes the unlock relay based on input from the door ajar switches and the vehicle speed signal. The DDM unlocks the doors when the following conditions are met:

- The vehicle speed has exceeded 5 km/h (3 mph) then dropped to 0 km/h (0 mph).
- The key is turned to the OFF or ACC position.
- The LH front door is opened within 10 minutes of the key being turned to the OFF or ACC position.

The auto-unlock feature is cancelled if the doors are locked with the door lock control switch or the Remote Keyless Entry (RKE) transmitter within the 10 minute active window. After the 10-minute active window expires, the auto-unlock feature does not unlock the doors if the driver door is opened.

The Instrument Cluster (IC) sends the vehicle speed signal over the Standard Corporate Protocol (SCP) network to the DDM . If the DDM does not receive the vehicle speed signal or it is invalid, the DDM sets DTC U1041.

**This pinpoint test is intended to diagnose the following:**

- Door ajar switch input
- Vehicle speed signal message from the IC
- DDM

**PINPOINT TEST M: THE AUTO-UNLOCK DOES NOT OPERATE CORRECTLY**

Test Step	Result / Action to Take
<b>M1 VERIFY THE AUTO-UNLOCK FEATURE IS ENABLED</b>	
<ul style="list-style-type: none"> <li>• Verify the auto-unlock feature is enabled. Refer to <u>Autolock and Auto-Unlock Programming</u> in this section.</li> <li>• <b>Is the auto-unlock feature enabled?</b></li> </ul>	<p><b>Yes</b> GO to <u>M2</u> .</p> <p><b>No</b> ENABLE the auto-unlock feature. REFER to <u>Autolock and Auto-Unlock Programming</u> in this section.</p>
<b>M2 CHECK THE COURTESY LAMP OPERATION</b>	
<ul style="list-style-type: none"> <li>• Open and close the doors while observing the courtesy lamp operation.</li> <li>• <b>Do the courtesy lamps operate correctly?</b></li> </ul>	<p><b>Yes</b> GO to <u>M3</u> .</p> <p><b>No</b> REFER to <u>Section 417-02</u> .</p>
<b>M3 RETRIEVE THE RECORDED DDM DTCs FROM THE SELF-TEST</b>	
<ul style="list-style-type: none"> <li>• Check the recorded results from the DDM self-test.</li> <li>• <b>Is continuous DTC U1041 retrieved?</b></li> </ul>	<p><b>Yes</b> REFER to <u>Section 413-01</u> to diagnose the speedometer.</p> <p><b>No</b> GO to <u>M4</u> .</p>
<b>M4 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the DDM connectors and make</li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or</p>

sure they seat correctly. • Operate the system and verify the concern is still present. • <b>Is the concern still present?</b>	corroded connector.
--	---------------------

## Pinpoint Test N: The Smart Unlock Does Not Operate Correctly

### Normal Operation

The Lighting Control Module (LCM) sends a network message to the Driver Door Module (DDM) that the key is in the ignition. If the DDM does not receive or receives invalid data for the key-in ignition from the LCM, it sets DTC U1135. The DDM monitors the network message, the door lock control switch and the driver door ajar switch. If the key is in the ignition and the driver door is open when the vehicle is locked with a door lock control switch, the DDM unlocks the driver door. The smart unlocking feature unlocks the LH front door one second after these conditions are met. The vehicle may still be locked with the key in the ignition using the manual lock button, a Remote Keyless Entry (RKE) transmitter, the keyless entry keypad or a key in the driver door lock cylinder.

**This pinpoint test is intended to diagnose the following:**

- Driver door ajar switch
- Key-in-ignition switch
- LCM
- DDM

### PINPOINT TEST N: THE SMART UNLOCK DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
<b>N1 CHECK THE COURTESY LAMP OPERATION</b>	
<ul style="list-style-type: none"> <li>• Open and close the doors while observing the courtesy lamp operation.</li> <li>• <b>Do the courtesy lamps operate correctly?</b></li> </ul>	<b>Yes</b> GO to <u>N2</u> .  <b>No</b> REFER to <u>Section 417-02</u> .
<b>N2 CHECK THE KEY-IN-IGNITION SWITCH OPERATION</b>	
<ul style="list-style-type: none"> <li>• Insert the key in the ignition lock cylinder.</li> <li>• Ignition OFF.</li> <li>• Open the driver door.</li> <li>• <b>Does the chime sound?</b></li> </ul>	<b>Yes</b> GO to <u>N3</u> .  <b>No</b> REFER to <u>Section 413-01</u> to continue diagnosis of the key-in-ignition warning system.
<b>N3 RETRIEVE THE RECORDED DDM DTCs FROM THE SELF-TEST</b>	
<ul style="list-style-type: none"> <li>• Check the recorded results from the DDM self-test.</li> </ul>	<b>Yes</b> GO to <u>N4</u> .  <b>No</b>

<ul style="list-style-type: none"> <li>• Is continuous DTC U1135 retrieved?</li> </ul>	GO to <u>N5</u> .
<b>N4 CHECK FOR CORRECT LCM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the LCM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the LCM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new LCM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>
<b>N5 CHECK FOR CORRECT DDM OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all the DDM connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion</li> <li>◆ damaged pins</li> <li>◆ pushed-out pins</li> </ul> </li> <li>• Connect all the DDM connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• Is the concern still present?</li> </ul>	<p><b>Yes</b> INSTALL a new DDM . REFER to <u>Section 419-10</u> . TEST the system for normal operation.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</p>

**Pinpoint Test O: Hard To Open/Close Door From Either Door Handle****Normal Operation**

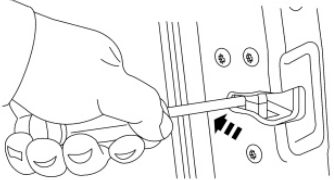

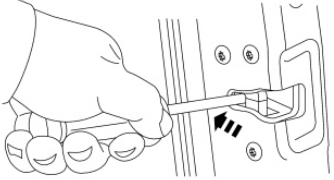

The door latch can be actuated from the interior or exterior door handle. When actuated, the door latch releases and allows the door to open. If the door latch or the door hinges have insufficient lubrication or if the striker or door are misaligned, it causes extra force to be used when opening or closing the door.

**This pinpoint test is intended to diagnose the following:**

- Door alignment
- Door hinges
- Striker adjustment
- Door latch

**PINPOINT TEST O: HARD TO OPEN/CLOSE DOOR FROM EITHER DOOR HANDLE**

Test Step	Result / Action to Take
<b>O1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES</b>	

<ul style="list-style-type: none"> <li>• For the rear doors, make sure the childlock is in the unlock position.</li> <li>• Open and close the door using both the interior and exterior door handles.</li> <li>• <b>Does the door open normally from one of the door handles?</b></li> </ul>	<p><b>Yes</b> If the door is difficult/does not open from the exterior door handle, <u>GO to Pinpoint Test P</u> .</p> <p>If the door is difficult/does not open from the interior door handle, <u>GO to Pinpoint Test Q</u> .</p> <p><b>No</b> If the door does not operate correctly from both door handles, GO to <u>Q2</u> .</p>
<b>O2 CHECK THE LATCH OPERATION</b>	
<ul style="list-style-type: none"> <li>• Open the door.</li> <li>• Using a screwdriver, fully close the latch (2 clicks).</li> </ul>  <p>N0094195</p> <ul style="list-style-type: none"> <li>• Verify that the latch releases easily while pulling on the interior/exterior door handle.</li> <li>• <b>Does the latch release easily?</b></li> </ul>	<p><b>Yes</b> GO to <u>Q4</u> .</p> <p><b>No</b> GO to <u>Q3</u> .</p>
<b>O3 CHECK THE LATCH OPERATION AFTER LUBRICATION</b>	
<ul style="list-style-type: none"> <li>• Lubricate the door latch. Refer to <u>Latch Lubrication</u> in this section.</li> <li>• Using a screwdriver, fully close the latch (2 clicks).</li> </ul>  <p>N0094195</p> <ul style="list-style-type: none"> <li>• Verify that the latch releases easily while pulling on the interior/exterior door handle.</li> <li>• <b>Does the latch release easily?</b></li> </ul>	<p><b>Yes</b> The concern was caused by an insufficiently lubricated door latch.</p> <p><b>No</b> INSTALL a new door latch. REFER to <u>Front Door Latch</u> or <u>Rear Door Latch</u> in this section. TEST the system for normal operation.</p>
<b>O4 CHECK THE STRIKER ADJUSTMENT</b>	
	<p><b>Yes</b> GO to <u>Q5</u> .</p>

<ul style="list-style-type: none"> <li>• Check the adjustment of the striker. Refer to <a href="#">Section 501-03</a> .</li> <li>• <b>Is the striker adjusted correctly?</b></li> </ul>	<b>No</b> ADJUST the striker as necessary. TEST the system for normal operation.
<b>O5 CHECK THE DOOR ALIGNMENT</b>	
<ul style="list-style-type: none"> <li>• Check the alignment of the door. Refer to <a href="#">Section 501-03</a> .</li> <li>• <b>Is the door aligned correctly?</b></li> </ul>	<b>Yes</b> LUBRICATE the door hinges. TEST the system for normal operation.  <b>No</b> ADJUST the door as necessary. TEST the system for normal operation.

### Pinpoint Test P: A Door Is Difficult/Does Not Open From The Exterior Door Handle

#### Normal Operation

The exterior door handle is connected to the door latch with an actuating rod. When the exterior door handle is pulled it causes the actuating rod to push down on the latch lever. The actuating rod can be adjusted for correct exterior door handle operation. When the latch lever is moved, the door latch releases, allowing the door to open.

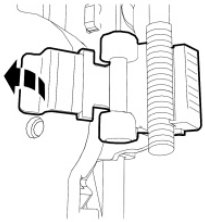

**This pinpoint test is intended to diagnose the following:**

- Broken or binding linkage
- Exterior door handle to latch rod adjustment
- Exterior door handle
- Door latch

#### PINPOINT TEST P: A DOOR IS DIFFICULT/DOES NOT OPEN FROM THE EXTERIOR DOOR HANDLE

Test Step	Result / Action to Take
<b>P1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES</b>	
<ul style="list-style-type: none"> <li>• Open and close the door using both the interior and exterior door handles.</li> <li>• <b>Does the door open normally from one of the door handles?</b></li> </ul>	<b>Yes</b> If the door is difficult/does not open from only the exterior door handle, GO to <a href="#">P2</a> .  <b>No</b> If the door does not operate correctly from both door handles, <a href="#">GO to Pinpoint Test Q</a> .
<b>P2 CHECK THE EXTERIOR DOOR HANDLE</b>	
<ul style="list-style-type: none"> <li>• Remove the door trim panel. Refer to <a href="#">Section 501-05</a> .</li> <li>• Open the clip and disconnect the exterior door handle actuating rod.</li> </ul>	<b>Yes</b> GO to <a href="#">P3</a> .  <b>No</b> INSTALL a new exterior door handle. REFER to <a href="#">Exterior Front Door Handle</a> or <a href="#">Exterior Rear Door Handle</a> in this section. TEST the system for normal operation.

 <p>N0088081</p> <ul style="list-style-type: none"> <li>• Pull and release the exterior door handle.</li> <li>• <b>Does the exterior door handle operate correctly?</b></li> </ul>	
<b>P3 CHECK THE EXTERIOR DOOR HANDLE AND LINKAGE OPERATION</b>	
<ul style="list-style-type: none"> <li>• Operate the exterior door handle while observing the linkage.</li> <li>• <b>Are any of the exterior door handle components or linkages binding or broken?</b></li> </ul>	<p><b>Yes</b> REPAIR as necessary. TEST the system for normal operation.</p> <p><b>No</b> GO to <u>P4</u> .</p>
<b>P4 CARRY OUT THE EXTERIOR DOOR HANDLE ADJUSTMENT</b>	
<ul style="list-style-type: none"> <li>• Carry out the exterior door handle to latch rod adjustment. Refer to <u>Door Handle to Latch Rod Adjustment</u> in this section.</li> <li>• <b>Does the exterior door handle operate correctly?</b></li> </ul>	<p><b>Yes</b> The concern was caused by an improperly adjusted exterior door handle.</p> <p><b>No</b> INSTALL a new door latch. REFER to <u>Front Door Latch</u> or <u>Rear Door Latch</u> in this section. TEST the system for normal operation.</p>

### Pinpoint Test Q: A Door Is Difficult/Does Not Open From The Interior Door Handle

#### Normal Operation

The interior door handle is connected to the door latch by an actuating linkage. When the interior door handle is pulled it causes the linkage to pull on the latch lever. When the latch lever is moved, the door latch releases, allowing the door to open.

**This pinpoint test is intended to diagnose the following:**

- Broken or binding linkage
- Door latch

#### PINPOINT TEST Q: A DOOR IS DIFFICULT/DOES NOT OPEN FROM THE INTERIOR DOOR HANDLE

Test Step	Result / Action to Take
<b>Q1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES</b>	
<ul style="list-style-type: none"> <li>• For the rear doors, make sure the childlock is in the unlock position.</li> </ul>	<p><b>Yes</b> If the door is difficult/does not open from only the interior door handle, GO to <u>Q2</u> .</p>

#### PINPOINT TEST P: A DOOR IS DIFFICULT/DOES NOT OPEN FROM THE EXTERIOR DOOR HANDLE

<ul style="list-style-type: none"> <li>• Open and close the door using both the interior and exterior door handles.</li> <li>• <b>Does the door open normally from one of the door handles?</b></li> </ul>	<p><b>No</b> If the door does not operate correctly from both door handles, <u>GO to Pinpoint Test Q</u> .</p>
<b>Q2 CHECK THE INTERIOR DOOR HANDLE AND LINKAGE OPERATION</b>	
<ul style="list-style-type: none"> <li>• Remove the door trim panel. Refer to <u>Section 501-05</u> .</li> <li>• Install the interior door handle back onto the linkage.</li> <li>• Operate the interior door handle while observing the linkage.</li> <li>• <b>Are any of the interior door handle components or linkages binding or broken?</b></li> </ul>	<p><b>Yes</b> REPAIR as necessary. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new door latch. REFER to <u>Front Door Latch</u> or <u>Rear Door Latch</u> in this section. TEST the system for normal operation.</p>

**Pinpoint Test R: Exterior Door Release Handle Sticks****Normal Operation**

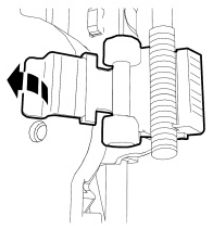

The exterior door handle is connected to the door latch with an actuating rod. When the exterior door handle is pulled it causes the actuating rod to push down on the latch lever. The actuating rod can be adjusted for correct exterior door handle operation. When the latch lever is moved, the door latch releases, allowing the door to open. The handle has a return spring to make sure the handle returns to a closed position.

**This pinpoint test is intended to diagnose the following:**

- Binding linkage
- Broken handle return spring
- Exterior door handle adjustment
- Door latch

**PINPOINT TEST R: EXTERIOR DOOR RELEASE HANDLE STICKS**

Test Step	Result / Action to Take
<b>R1 CHECK FOR A BROKEN RETURN SPRING</b>	
<ul style="list-style-type: none"> <li>• Remove the door trim panel. Refer to <u>Section 501-05</u> .</li> <li>• Open the clip and disconnect the exterior door handle actuating rod.</li> </ul>	<p><b>Yes</b> GO to <u>R2</u> .</p> <p><b>No</b> INSTALL a new exterior door handle. REFER to <u>Exterior Front Door Handle</u> or <u>Exterior Rear Door Handle</u> in this section. TEST the system for normal operation.</p>

 <p>N0088081</p> <ul style="list-style-type: none"> <li>• Pull and release the exterior door handle.</li> <li>• <b>Does the exterior door handle return to a closed position once released?</b></li> </ul>	
<b>R2 CARRY OUT THE EXTERIOR DOOR HANDLE ADJUSTMENT</b>	
<ul style="list-style-type: none"> <li>• Carry out the exterior door handle to latch rod adjustment. Refer to <u>Door Handle to Latch Rod Adjustment</u> in this section.</li> <li>• <b>Does the exterior door handle operate correctly?</b></li> </ul>	<p><b>Yes</b> The concern was caused by an improperly adjusted exterior door handle.</p> <p><b>No</b> GO to <u>R3</u> .</p>
<b>R3 CHECK THE EXTERIOR DOOR HANDLE AND LINKAGE OPERATION</b>	
<ul style="list-style-type: none"> <li>• Operate the exterior door handle while observing the linkage.</li> <li>• <b>Are any of the exterior door handle components or linkages binding?</b></li> </ul>	<p><b>Yes</b> REPAIR as necessary. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new door latch. REFER to <u>Front Door Latch</u> or <u>Rear Door Latch</u> in this section. TEST the system for normal operation.</p>

**Pinpoint Test S: Interior Door Release Handle Sticks****Normal Operation**

The interior door handle is connected to the door latch by an actuating linkage. When the interior door handle is pulled it causes the linkage to pull on the latch lever. When the latch lever is moved, the door latch releases, allowing the door to open. The handle has a return spring to make sure the handle returns to a closed position.

**This pinpoint test is intended to diagnose the following:**

- Binding linkage
- Broken handle return spring
- Door latch

**PINPOINT TEST S: INTERIOR DOOR RELEASE HANDLE STICKS**

Test Step	Result / Action to Take
<b>S1 CHECK FOR A BROKEN RETURN SPRING</b>	
<ul style="list-style-type: none"> <li>• Remove the interior door handle.</li> </ul>	<p><b>Yes</b> GO to <u>S2</u> .</p>

<ul style="list-style-type: none"> <li>• Pull and release the interior door handle.</li> <li>• <b>Does the interior door handle return to a closed position once released?</b></li> </ul>	<b>No</b> INSTALL a new interior door handle.
<b>S2 CHECK THE INTERIOR DOOR HANDLE LINKAGE OPERATION</b>	
<ul style="list-style-type: none"> <li>• Remove the door trim panel. Refer to <a href="#">Section 501-05</a> .</li> <li>• Observe the door latch release linkage for any damage or binding.</li> <li>• <b>Is the door latch release linkage OK?</b></li> </ul>	<b>Yes</b> INSTALL a new door latch. REFER to <a href="#">Front Door Latch</a> or <a href="#">Rear Door Latch</a> in this section. TEST the system for normal operation.  <b>No</b> REPAIR as necessary. TEST the system for normal operation.

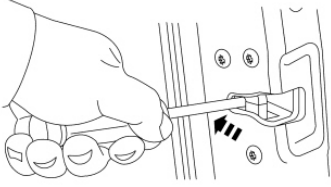

**Pinpoint Test T: Squeak/Rattle/Chucking Noise From Door**

This pinpoint test is intended to diagnose the following:

- Door alignment
- Striker adjustment
- Door latch

**PINPOINT TEST T: SQUEAK/RATTLE/CHUCKING NOISE FROM DOOR**

Test Step	Result / Action to Take
<b>T1 CHECK FOR ANY LOOSE COMPONENTS</b>	
<ul style="list-style-type: none"> <li>• Remove the door trim panel. Refer to <a href="#">Section 501-05</a> .</li> <li>• Inspect inside the door for any loose components.</li> <li>• <b>Are there any loose components inside the door?</b></li> </ul>	<b>Yes</b> REPAIR as necessary. TEST the system for normal operation.  <b>No</b> GO to <a href="#">T2</a> .
<b>T2 CHECK THE STRIKER ADJUSTMENT</b>	
<ul style="list-style-type: none"> <li>• Check the adjustment of the striker. Refer to <a href="#">Section 501-03</a> .</li> <li>• <b>Is the striker adjusted correctly?</b></li> </ul>	<b>Yes</b> GO to <a href="#">T3</a> .  <b>No</b> ADJUST the striker as necessary. TEST the system for normal operation.
<b>T3 CHECK THE DOOR ALIGNMENT</b>	
<ul style="list-style-type: none"> <li>• Check the alignment of the door. Refer to <a href="#">Section 501-03</a> .</li> <li>• <b>Is the door aligned correctly?</b></li> </ul>	<b>Yes</b> GO to <a href="#">T4</a> .  <b>No</b> ADJUST the door as necessary. TEST the system for

	normal operation.
<b>T4 CHECK THE LATCH OPERATION AFTER LUBRICATION</b>	
<ul style="list-style-type: none"> <li>• Lubricate the door latch. Refer to <u>Latch Lubrication</u> in this section.</li> <li>• Using a screwdriver, fully close the latch (2 clicks).</li> </ul>  <p>N0094195</p> <ul style="list-style-type: none"> <li>• Operate the door latch and listen for the noise.</li> <li>• <b>Is the original noise still present after the latch is lubricated?</b></li> </ul>	<p><b>Yes</b> INSTALL a new door latch. REFER to <u>Front Door Latch</u> or <u>Rear Door Latch</u> in this section. TEST the system for normal operation.</p> <p><b>No</b> The concern was caused by an insufficiently lubricated door latch.</p>

### Pinpoint Test U: Manual Door Lock Cylinder Inoperative

#### Normal Operation

The door lock cylinder is connected to the door latch via a lock rod and can be used to manually lock/unlock a door.

**This pinpoint test is intended to diagnose the following:**

- Bent or binding lock rod and lever
- Door lock cylinder
- Door latch

#### PINPOINT TEST U: MANUAL DOOR LOCK CYLINDER INOPERATIVE

Test Step	Result / Action to Take
<b>U1 CHECK THE LOCK CYLINDER OPERATION AFTER LUBRICATION</b>	
<ul style="list-style-type: none"> <li>• Spray a lock lubricant such as Motorcraft XL-1 into the lock cylinder opening for a couple seconds.</li> <li>• Operate the door lock cylinder with the key.</li> <li>• <b>Does the door lock and unlock using the door lock</b></li> </ul>	<p><b>Yes</b> The concern was caused by an insufficiently lubricated lock cylinder. Spray a multi-purpose grease such as Motorcraft XL-5 into the lock cylinder for a couple seconds to provide long term lubrication.</p> <p><b>No</b> GO to <u>U2</u> .</p>

<b>cylinder?</b>	
<b>U2 CHECK THE DOOR LOCK CYLINDER</b>	
<ul style="list-style-type: none"> <li>• Remove the door lock cylinder. Refer to <u>Door Lock Cylinder</u> in this section.</li> <li>• Operate the door lock cylinder with the key.</li> <li>• <b>Does the door lock cylinder rotate freely to both lock and unlock positions?</b></li> </ul>	<p><b>Yes</b> GO to <u>U3</u> .</p> <p><b>No</b> INSTALL a new door lock cylinder. REFER to <u>Door Lock Cylinder</u> in this section. TEST the system for normal operation.</p>
<b>U3 CHECK THE DOOR LOCK CYLINDER LINKAGE</b>	
<ul style="list-style-type: none"> <li>• Operate the door lock cylinder while observing the linkage.</li> <li>• <b>Is the door lock cylinder rod and lever bent or binding?</b></li> </ul>	<p><b>Yes</b> REPAIR as necessary. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new door latch. REFER to <u>Front Door Latch</u> in this section. TEST the system for normal operation.</p>

## **Keyless Entry Keypad Code Programming**

### **Programming A Personal Keyless Entry Keypad Code**

**NOTE:** Up to 3 personal keyless entry keypad codes can be programmed.

1. Enter the factory set keyless entry keypad code.
2. Within 5 seconds, press the 1/2 button on the keypad.
3. Enter the personal 5-digit keyless entry keypad code. Each number must be pressed within 5 seconds of each other.
4. To store each new personal code, press the 1/2 button within 5 seconds of entering the fifth digit of the new code to store the first code, for the second code press the 3/4 button, or for the third code press the 5/6, 7/8, or 9/0. The doors lock then unlock, confirming the new code is programmed.
5. The door locks lock and unlock, confirming the new code is programmed.

### **Erasing the Personal Keyless Entry Keypad Codes**

1. Enter the factory set keyless entry keypad code.
  2. Within 5 seconds, press and release the 1/2 button.
  3. Within 5 seconds, press and hold the 1/2 button for 2 seconds.
  4. The personal codes are now erased and only the factory set code will work.
-

### **Remote Keyless Entry (RKE) Transmitter Programming**

**NOTE:** Programming must be done at the same time for all the Remote Keyless Entry (RKE) transmitters.

**NOTE:** Programming of the RKE transmitters can be accomplished using a scan tool or by carrying out the following steps:

1. Turn the key from OFF to RUN 8 times within 10 seconds, ending in RUN. The doors lock then unlock, confirming program mode has been entered.
  2. Press any button on each RKE transmitter to be programmed. The doors lock and unlock to confirm that each RKE transmitter has been programmed.
  3. If additional RKE transmitters are to be programmed, repeat Step 2 within 7 seconds. If more than 7 seconds have elapsed, the entire procedure must be repeated.
  4. To exit program mode, wait at least 7 seconds or turn the ignition key to the OFF position.
  5. Wait at least 20 seconds after turning the key to the OFF position, or after the last RKE transmitter is programmed, to activate an RKE transmitter for testing and verification.
-

## **Autolock and Auto-Unlock Programming**

### **Autolock**

**NOTE:** This procedure must be completed within 30 seconds.

1. Close all the doors.
2. Turn the key to the OFF position.
3. Turn the key to the RUN position.
4. Press the UNLOCK button 3 times.
5. Turn the key to the OFF position.
6. Press the UNLOCK button 3 times.
7. Turn the key to the RUN position. The doors lock and unlock to confirm entry into program mode.
8. Press the UNLOCK then the LOCK button once to toggle the autolock feature on or off. The horn chirps once if autolock was deactivated or a chirp followed by a honk if autolock was activated.
9. Exit program mode by turning the key to the OFF position.
10. Drive the vehicle to confirm autolock status.

### **Auto-Unlock**

**NOTE:** This procedure must be completed within 30 seconds.

1. Close all the doors.
2. Turn the key to the OFF position.
3. Turn the key to the RUN position.
4. Press the UNLOCK button 3 times.
5. Turn the key the OFF position.
6. Press the UNLOCK button 3 times.
7. Turn the key to the RUN position. The doors lock and unlock to confirm entry into program mode.
8. Press the LOCK then the UNLOCK button once to toggle the auto-unlock feature on or off. The horn chirps once if auto-unlock was deactivated or a chirp followed by a honk if auto-unlock was activated.
9. Exit program mode by turning the key to the OFF position.

10. Drive the vehicle to confirm auto-unlock status.
-

**Latch Lubrication**

## Material

Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

1. Open the door.
2. Using a screwdriver, fully close the latch (2 clicks).

3. Spray the multi-purpose grease into the opening on the door latch for approximately 5 seconds.

4. Open the latch using either the interior or exterior door handle.
  5. Open and close the door several times to circulate the lubricant inside the latch.
  6. Wipe off any excess grease.
-

### Door Handle to Latch Rod Adjustment

**NOTE:** If the vehicle is equipped with an adjustable door latch actuating rod, perform this procedure.

**NOTE:** An incorrectly adjusted exterior door handle can cause a loose handle, rattle noise, door hard to open from the outside door handle, or the outside door handle to not sit flush in the closed position.

**NOTE:** Prior to carrying out the adjustment procedure, the door latch, exterior door handle, and linkages must be installed on the door.

1. Raise the door glass to the full-up position.
2. Remove the door trim panel. For additional information, refer to [Section 501-05](#).
3. Position the water shield aside.
4. Open the clip and disconnect the exterior door handle actuating rod.

5. Position the actuating rod and latch actuating lever in a neutral position.
6. **NOTE:** Do not push up or pull down on the actuating rod or latch actuating lever.

Reinstall the exterior door handle actuating rod back into the clip.

7. Close the clip and test the system to make sure that the exterior door handle is operating correctly.
  8. Reseal the water shield.
  9. Install the door trim panel. For additional information, refer to [Section 501-05](#).
-

**Hood Latch and Components - Exploded View**

Item	Part Number	Description
1	W706519	Pin-type retainers (6 required)
2	8C291	Radiator sight shield
3	N606677	Hood latch bolts (2 required)
4	16700	Hood latch
5	-	Hood latch release cable and handle (part of 16916)
6	W611104	Hood latch release cable handle bolt
7	N620480	Hood latch release cable handle nut
8	16916	Hood latch release handle

1. For additional information, refer to the procedures in this section.

## Hood Latch

### Removal and Installation

1. Remove the 6 pin-type retainers and the radiator sight shield.
2. **NOTE:** Mark the position of the hood latch prior to removal of the bolts.

Remove the 2 hood latch bolts.

- To install, tighten to 12 Nm (106 lb-in).
3. Disconnect the cable and remove the hood latch.
  4. To install, reverse the removal procedure.
    - Check the hood latch adjustment to make sure the hood striker engages the hood latch correctly.
-

## **Hood Latch Release Handle**

### **Removal and Installation**

1. Remove the LH fender splash shield. For additional information, refer to Section 501-02 .
  2. Remove the hood latch. For additional information, refer to Hood Latch in this section.
  3. Release the hood latch release cable locators.
  4. Remove the bolt, the nut and the hood latch release handle and cable.
    - To install, tighten to 5 Nm (44 lb-in).
  5. To install, reverse the removal procedure.
-

**Front Door Handles, Locks and Latches - Exploded View**

Item	Part Number	Description
1	5422642	Interior door handle cup cover
2	W505584	Interior door handle screw
3	5421818/ 5421819	Interior door handle (RH/LH)
4	W525172	Interior door handle remote control rivets (3 required)
5	54219A64/ 54219A65	Interior door handle remote control (RH/LH)
6	5422152/ 5422153	Door lock cylinder actuating rod (RH/LH)
7	5422134/ 5422135	Exterior door handle actuating rod (RH/LH)
8	5421850/ 5421851	Door lock push button rod (RH/LH)
9	W712650	Door lock actuator rivet
10	W710772-S900	Front door latch screws (3 required)
11	5421812/ 5421813	Front door latch (RH/LH)
12	54218A42	Door lock actuator
13	5421940/ 5421941	Interior door handle remote control actuating rod (RH/LH)
14	5422023	Door lock cylinder clip
15	5421990/ 5421991	Door lock cylinder (RH/LH)
16	W712650	Exterior door handle rivets (2 required)
17	5422404/ 5422405	Exterior door handle (RH/LH)

1. For additional information, refer to the procedures in this section.
-

## Front Door Latch

### Special Tool(s)

	<p>Heavy Duty Riveter 501-D011 (D80L-23200-A)</p>
---	---

### Removal and Installation

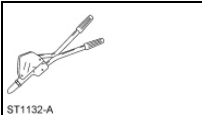

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#) .
2. Position the watershield aside.
3. Remove the 3 rivets and position the interior door handle remote control aside.
4. Open the clip and release the exterior door handle actuating rod.
5. If equipped, disconnect the door lock cylinder actuating rod from the door lock cylinder.
6. Disconnect the door ajar switch electrical connectors.
7. Disconnect the door lock actuator electrical connector.
8. Remove the door lock actuator rivet.
9. Remove the 3 screws and the front door latch.
  - To install, tighten to 6 Nm (53 lb-in).
10. To install, reverse the removal procedure.
  - Use the special tool to install the new rivets.

---

## Front Door Lock Actuator

### Special Tool(s)

	Heavy Duty Riveter 501-D011 (D80L-23200-A)
---	---

### Removal and Installation

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#) .
  2. Position the watershield aside.
  3. Disconnect the door lock actuator electrical connector.
  4. Remove the door lock actuator rivet.
  5. Remove the door lock actuator.
  6. To install, reverse the removal procedure.
    - Use the special tool to install the new rivets.
-

## **Door Ajar Switch - Front**

### **Removal and Installation**

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
  2. Disconnect the 2 electrical connectors.
  3. Remove the screw and the door ajar switch.
  4. To install, reverse the removal procedure.
-

## Exterior Front Door Handle

### Special Tool(s)

	Heavy Duty Riveter 501-D011 (D80L-23200-A)
---	---

### Removal and Installation

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#) .
  2. Position the watershield aside.
  3. Open the clip and release the exterior door handle actuating rod.
  4. Remove the 2 rivets and the exterior door handle.
  5. To install, reverse the removal procedure.
    - Use the special tool to install the new rivets.
-

## Door Lock Cylinder

### Removal and Installation

**NOTE:** Individual lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

1. Remove the exterior front door handle. For additional information, refer to Exterior Front Door Handle in this section.
  2. Disconnect door lock cylinder actuating rod.
  3. If equipped, disconnect the door disarm switch electrical connector.
  4. Remove the clip and the door lock cylinder.
  5. To install, reverse the removal procedure.
-

**Rear Door Handles, Locks and Latches - Exploded View**

Item	Part Number	Description
1	5422642/ 5422643	Interior door handle screw cover
2	W505584	Interior door handle screw
3	5422634/ 5422635	Interior door handle (RH/LH)
4	W525172	Interior door handle remote control rivets (3 required)
5	54264B52/ 54264B53	Interior door handle remote control (RH/LH)
6	W705528	Lock rod bellcrank rivet
7	54264B14/ 54264B15	Lock rod and bellcrank (RH/LH)
8	5421850/ 5421851	Push button rod (police only) (RH/LH)
9	5426596	Exterior door handle actuating rod
10	W712650	Door lock actuator rivet
11	W710772-S900	Rear door latch screws (3 required)
12	5426412/ 5426413	Rear door latch (RH/LH)
13	5426442/ 5426443	Interior door handle actuating rod (RH/LH)
14	5426594	Door lock actuator
15	W707874	Exterior door handle rivets (2 required)
16	5426604/ 5426605	Exterior door handle (RH/LH)

1. For additional information, refer to the procedures in this section.

**Rear Door Latch**

## Special Tool(s)

	Heavy Duty Riveter 501-D011 (D806-23200-A)
---	---

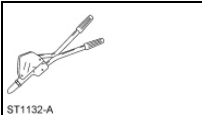

**Removal and Installation**

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
  2. Position the watershield aside.
  3. Remove the 3 rivets and position the interior door handle remote control aside.
  4. If equipped with the police package, remove the door lock push button rod cover.
  5. Remove the door lock push button rod bellcrank rivet.
  6. Disconnect the door lock push button rod from the lock rod bellcrank.
  7. Release the door lock push button rod from the clip.
  8. Open the clip and release the exterior door handle actuating rod.
  9. Disconnect the door ajar switch electrical connectors.
  10. Disconnect the door lock actuator electrical connector.
  11. Remove the door lock actuator rivet.
  12. Remove the 3 screws and remove the rear door latch.
    - To install, tighten to 6 Nm (53 lb-in).
  13. To install, reverse the removal procedure.
    - Use the special tool to install the new rivets.
-

## Rear Door Lock Actuator

### Special Tool(s)

	Heavy Duty Riveter 501-D011 (D80L-23200-A)
---	---

### Removal and Installation

1. Remove the rear door latch. For additional information, refer to Rear Door Latch in this section.
  2. Remove the door lock actuator.
  3. To install, reverse the removal procedure.
    - Use the special tool to install the new rivets.
-

## **Door Ajar Switch - Rear Door**

### **Removal and Installation**

1. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#) .
  2. Disconnect the 2 electrical connectors.
  3. Remove the screw and the door ajar switch.
  4. To install, reverse the removal procedure.
-

## Exterior Rear Door Handle

### Special Tool(s)

	Heavy Duty Riveter 501-D011 (D80L-23200-A)
---	---

### Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#) .
  2. Position the watershield aside.
  3. Open the clip and release the exterior door handle actuating rod.
  4. Remove the 2 rivets and remove the exterior door handle.
  5. To install, reverse the removal procedure.
    - Use the special tool to install the new rivets.
-

**Luggage Compartment Lid Latch**

Item	Part Number	Description
1	-	Luggage compartment lid latch electrical connector (part of 14A227)
2	W712308	Luggage compartment lid latch bolts (3 required)
3	-	Luggage compartment lid lock cylinder cable (part of 5443200)
4	5443200	Luggage compartment lid latch

**Removal and Installation**

1. Disconnect the luggage compartment lid latch electrical connector.
2. Disconnect the luggage compartment lid lock cylinder cable from the lock cylinder.
3. Remove the bolts and the luggage compartment lid latch.
  - To install, tighten to 12 Nm (106 lb-in).
4. To install, reverse the removal procedure.

**Luggage Compartment Lid Lock Cylinder**

## Special Tool(s)

 ST1132-A	Heavy Duty Riveter 501-D011 (D80L-23200-A)
---	---

N0026729

Item	Part Number	Description
1	-	Luggage compartment lid lock cylinder cable (part of 5443200)
2	N602701	Luggage compartment lid lock cylinder rivets (2 required)
3	5443262	Luggage compartment lid lock cylinder

**Removal and Installation**

**NOTE:** Individual lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

1. Remove the license plate housing. For additional information, refer to [Section 501-08](#).
2. Release the clips and disconnect the luggage compartment lid lock cylinder cable.
3. If equipped, disconnect the luggage compartment anti-theft inhibit switch electrical connector.

4. Remove the 2 luggage compartment lid lock cylinder rivets.
  5. Remove the luggage compartment lid lock cylinder.
  6. To install, reverse the removal procedure.
    - Use the special tool to install the new rivets.
-

**Ignition Lock Cylinder - Functional**

Item	Part Number	Description
1	3F609	Tilt wheel handle and shank
2	55929	Lower steering column shroud screws (3 required)
3	3530	Lower steering column shroud
4	3530	Selector lever boot (if equipped)
5	-	Ignition key
6	15607	Passive Anti-Theft System (PATS) transceiver
7	-	Ignition lock cylinder release pin (part of 11582)
8	11582	Ignition lock cylinder

**Removal**

1. Remove the steering column shroud. For additional Information, refer to [Section 211-04](#) .
2. If equipped, position the selector lever boot aside.
3. Insert the ignition key and position the ignition lock cylinder to the RUN position.
4. Release the 2 Passive Anti-Theft System (PATS) transceiver tabs and rotate the PATS transceiver In order to access to the ignition lock cylinder release pin hole.
5. Using a suitable tool, depress the ignition lock cylinder release pin through the access hole while pulling the ignition lock cylinder outward.

**Installation**

1. Make sure the ignition lock cylinder is in the RUN position.
  2. Insert the ignition lock cylinder into the ignition lock cylinder access hole located on the steering column.
    - Make sure to align the locking pin with the locking pin access hole.
  3. Rotate the Passive Anti-Theft System (PATS) transceiver and attach the 2 retaining tabs onto the steering column.
  4. Install the steering column shroud. For additional Information, refer to Section 211-04 .
  5. Rotate the ignition key through all lock cylinder positions to check for correct operation.
-

## Ignition Lock Cylinder - Non Functional

### Removal and Installation

1. Disconnect the battery. For additional information, refer to [Section 414-01](#) .
2. Remove the steering wheel. For additional information, refer to [Section 211-04](#) .
3. Remove the tilt wheel handle and shank.
4. Remove the 3 screws and the lower steering column shroud.

5. If equipped, position the shift selector boot aside.
6. Twist off the cap from the ignition lock cylinder.

7. Release the tabs and slide the Passive Anti-Theft System (PATS) transceiver off the steering column.
8. Disconnect the electrical connector and remove the PATS transceiver.
9. Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.

10. Use a 3/8-inch diameter drill to drill down the middle of the ignition lock cylinder key slot until the ignition lock cylinder breaks loose.

11. Remove and discard the ignition lock cylinder and drill shavings from the steering column.
    - Thoroughly clean all drill shavings from the steering column and inspect it for damage.
  12. To install, reverse the removal procedure.
-

---

**Door Lock Control Switch**

**NOTE:** Driver side shown, passenger side similar.

Item	Part Number	Description
1	14527/14528	Door switch plate (LH/RH)
2	-	Door lock switch electrical connector (part of 14A005)
3	14028	Door lock control switch

**Removal and Installation**

1. Lift up on the front of the switch plate to unclip it from the front door trim panel and position it aside.
  2. Disconnect the electrical connectors.
  3. Release the clips and remove the door lock control switch.
  4. To install, reverse the removal procedure.
-

**Keyless Entry Keypad**

Item	Part Number	Description
1	14A667	Keyless entry keypad clip
2	14A626	Keyless entry keypad
3	-	Keyless entry keypad electrical connector (part of 14A005)

**Removal and Installation**

1. Remove the LH front door trim panel. For additional information, refer to [Section 501-05](#).
2. Position the watershield aside.
3. Remove the clip and the keyless entry keypad.
  - Disconnect the electrical connector.
4. To install, reverse the removal procedure.

**Antenna**

Item	Part Number	Description
1	-	Antenna electrical connector (part of 14A005)
2	N807122	Antenna screws (2 required)
3	15K602	Antenna

**Removal and Installation**

1. Remove the RH rear quarter trim panel. For additional information, refer to [Section 501-05](#).
2. Disconnect the antenna electrical connector.
3. Remove the 2 screws and the antenna.
4. To install, reverse the removal procedure.

## Material

Item	Specification	Fill Capacity
Motorcraft® Premium Quality Windshield Washer Fluid (Canada) CXC-37-(A, B, D, and F) (Canada)	-	-
Motorcraft® Premium Windshield Washer Concentrate (US) ZC-32-A or B (US)	WSB-M8B16-A2	-

## General Specifications

Item	Specification
LH wiper pivot arm installation position	58 mm (2.28 in)
RH wiper pivot arm installation position	60 mm (2.36 in)

## Torque Specifications

Description	Nm	lb-in
Evaporative emission canister purge valve nuts	6	53
Windshield washer pump and reservoir bolts	6	53
Windshield wiper motor bolts	13	115
Wiper mounting arm and pivot shaft bolts	12	106

## Wipers and Washers

The windshield wiper/washer system consists of the following components:

- Windshield wiper blades
- Windshield wiper pivot arm
- Windshield wiper mounting arm and pivot shaft assembly
- Windshield wiper motor
- Windshield washer nozzle
- Windshield washer reservoir
- Windshield washer pump

The wiper system is activated by the multifunction switch. The multifunction switch provides input to the front wiper motor module to activate wash, low, high and intermittent modes.

The washer system consists of the washer reservoir and washer pump. When the multifunction switch is placed into the wash mode, the windshield wiper motor integral electronics activate the washer pump to direct washer fluid to the windshield.

If equipped with automatic headlamps, the Lighting Control Module (LCM) will illuminate the exterior lamps, including the parking lamps, when the front wipers are on for more than 10 seconds and the headlamp control is in the AUTOLAMP position. When the wipers are turned off, the exterior lamps will remain on for 30 seconds before turning off.

---

---

**Wipers and Washers****Special Tool(s)**

 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

**Principles of Operation**

The windshield wiper motor receives inputs from the following:

- Multifunction switch
- Lighting Control Module (LCM)
- Ignition switch
- Battery Junction Box (BJB)
- Central Junction Box (CJB)

The following components are integrated into the windshield wiper motor:

- Windshield wiper motor module
- High/low speed relay
- Run/park sensor (Hall effect)
- Washer pump relay

If equipped with automatic headlamps, the LCM will illuminate the exterior lamps, including the parking lamps, when the front wipers are on for more than 10 seconds.

**High-Speed Operation**

When the multifunction switch is set to the high-speed position, it supplies ground to the integral high/low speed relay coil and the integral run/park relay coil, which causes the windshield wiper motor to operate at high speed. During high-speed operation only, both the integral high/low-speed relay coil ground and the integral run/park relay coil ground are controlled directly by the multifunction switch. This differs from low speed or intermittent operation when the integral run/park relay coil is controlled by the microprocessor. When the switch is placed in the OFF position, the motor continues to operate until the motor returns to the PARK position and the internal Hall-effect sensor senses the motor magnet. The output to the integral run/park relay deactivates the relay and disconnects the voltage to the motor.

Since the integral high/low relay coil and the integral run/park relay coil are both controlled by a hardwired circuit to the multifunction switch, the windshield wipers will still operate in high speed mode if the internal

windshield wiper module fails, but will not automatically park when the multifunction switch is turned to the OFF position.

### Low-Speed

When the multifunction switch is set to the low-speed position, it supplies ground to the internal windshield wiper motor module low-speed inputs and the windshield wiper motor operates at low speed. During low-speed operation, the integral run/park relay is activated by the microprocessor and supplies 12 volts to the low-speed brush of the windshield wiper motor. The integral run/park relay coil ground is controlled by the internal windshield wiper motor module based on inputs received from the multifunction switch. When the switch is placed in the OFF position, the motor continues to operate until the motor returns to the PARK position and the internal Hall-effect sensor senses the motor magnet. The output to the integral run/park relay deactivates the relay and disconnects the voltage to the motor.

### Intermittent Speed

When the multifunction switch is set to the intermittent position(s), it supplies ground to the windshield wiper motor module inputs and the windshield wiper motor operates in intermittent mode. During intermittent operation, the windshield wiper motor activates the integral run/park relay coil which sends voltage through the integral high/low relay. The integral high/low relay remains deactivated, supplying the voltage to the low-speed brush of the windshield wiper motor. The windshield motor continues to operate until the internal Hall-effect sensor senses the magnet (PARK position) and deactivates the integral run/park relay, which disconnects voltage from the wiper motor. The windshield wipers remain parked until the windshield wiper motor module completes a time-out and then repeats the intermittent windshield wiper cycle.

### Washer System

The windshield washer system consists of the washer reservoir and washer pump. When WASH is selected on the multifunction switch, the windshield wiper motor module activates its integral washer relay which sends voltage to the washer pump to direct fluid to the windshield.

### Software Safe Mode

The windshield wiper motor defaults to software safe mode when the run/park sensor does not sense the Hall-effect magnet inside the wiper motor. This can be caused by an obstruction of the windshield wipers, a binding linkage or loss of the Hall sensor signal. The motor continues to operate in a high/low-speed condition, and when turned off, the wipers immediately park on the windshield. If necessary, the wipers can be turned on and off until they return to the PARK position.

**Windshield Wiper Circuit Function Table**

<b>Multifunction Switch Position</b>	<b>Circuit 680 (LB/OG)</b>	<b>Circuit 61 (YE/RD)</b>	<b>Circuit 56 (DB/OG)</b>	<b>Circuit 58 (WH)</b>	<b>Circuit 63 (RD)</b>

### Inspection and Verification

**⚠ WARNING:** If equipped with fire suppression system, refer to **Section 100-02B** for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

### Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Windshield washer hoses</li> <li>• Wiper linkage</li> <li>• Multifunction switch</li> </ul>	<ul style="list-style-type: none"> <li>• Battery Junction Box (BJB) fuse 110 (30A)</li> <li>• Central Junction Box (CJB) fuse 7 (10A)</li> <li>• Circuitry</li> <li>• Windshield wiper motor</li> </ul>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** The windshield wiper motor does not communicate on the network. The windshield wiper motor provides wiper on/off status directly to the Lighting Control Module (LCM).

**NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
  - check the scan tool connection to the VCM .
  - refer to **Section 418-00** , No Power To The Scan Tool, to diagnose no power to the scan tool.
6. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to **Section 418-00** to diagnose no response from the LCM .
  7. Carry out the network test.

- If the scan tool responds with no communication from one or more modules, refer to [Section 418-00](#).
- If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the LCM.

9. If the DTCs retrieved are related to the concern, to the Lighting Control Module (LCM) DTC Chart. For all other DTCs, refer to [Section 419-10](#).

10. If not DTCs related to the concern are retrieved, GO to [Symptom Chart](#).

### Lighting Control Module (LCM) DTC Chart

DTC	Description	Action
B1449	Wiper Park Sense Circuit Short to Ground	DISCONNECT LCM C2145D and windshield wiper motor C125. CHECK circuit 28 (BK/PK) for a short to ground. MEASURE the resistance between LCM C2145D-14, circuit 28 (BK/PK), harness side and ground. REPAIR the short to ground as needed. If circuit is OK, INSTALL a new LCM. CLEAR the DTC. CARRY OUT the self-test.
All other DTCs	-	REFER to the Master DTC Chart in <a href="#">Section 419-10</a> .

### Symptom Chart

Symptom Chart

### Pinpoint Tests

#### Pinpoint Test A: The Wipers are Inoperative

Refer to Wiring Diagrams Cell [81](#), Wipers and Washers for schematic and connector information.

#### Normal Operation

The windshield wiper motor receives battery voltage from the Battery Junction Box (BJB) through circuit 2025 (RD/YE), and voltage from the Central Junction Box (CJB) through circuit 65 (DG) when the ignition switch is in the RUN or ACC position. The windshield wiper motor is grounded through circuit 676 (PK/OG) and circuit 57 (BK). The windshield wiper motor receives open and ground inputs from the multifunction switch through circuits 56 (DB/OG), 58 (WH), 61 (YE/RD) and 63 (RD). When a wiper function is selected, the multifunction switch grounds 1 of several combinations of these 4 circuits. The windshield wiper motor interprets these ground signals and performs the action requested. The multifunction switch is grounded through circuit 57 (BK).

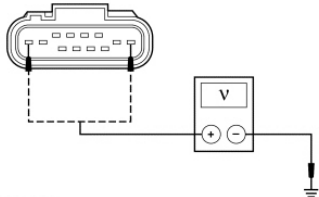

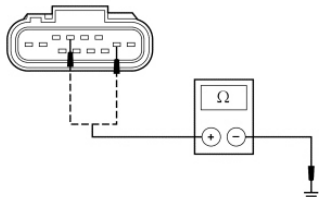

**This pinpoint test is intended to diagnose the following:**

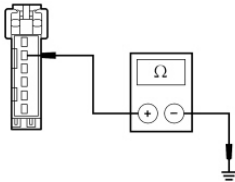

Normal Operation

- Fuse(s)
- Wiring, terminals or connectors
- Multifunction switch
- Windshield wiper motor

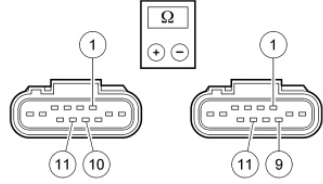

**PINPOINT TEST A: THE WIPERS ARE INOPERATIVE**

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>A1 CHECK THE VOLTAGE TO THE WIPER MOTOR</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Windshield Wiper Motor C125.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between windshield wiper motor C125-5, circuit 2025 (RD/YE), harness side and ground; and between windshield wiper motor C125-8, circuit 65 (DG), harness side and ground.</li> </ul>  <p>A0045928</p> <ul style="list-style-type: none"> <li>• <b>Are the voltages greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <u>A2</u> .</p> <p><b>No</b> VERIFY BJB fuse 110 (30A) and CJB fuse 7 (10A) are OK. ### Pinpoint Test B: The Wipers Stay On Continuously

Refer to Wiring Diagrams Cell 81 , Front Wipers and Washers for schematic and connector information.

#### Normal Operation

The windshield wiper motor receives open and ground inputs from the multifunction switch through circuits 56 (DB/OG), 58 (WH), 61 (YE/RD) and 63 (RD). When a wiper function is selected, the multifunction switch grounds 1 of several combinations of these 4 circuits. The windshield wiper motor interprets these ground signals and performs the action requested. The multifunction switch is grounded through circuit 57 (BK).

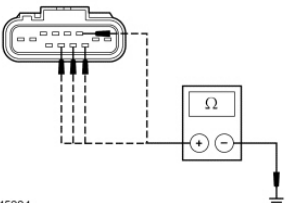

#### This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- Windshield wiper motor

### PINPOINT TEST B: THE WIPERS STAY ON CONTINUOUSLY

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>B1 CHECK THE MULTIFUNCTION SWITCH</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Multifunction Switch C202B.</li> </ul>	<p><b>Yes</b> GO to <u>B2</u> .</p>

<p><b>B3 CHECK FOR CORRECT WIPER MOTOR OPERATION</b></p>	
<ul style="list-style-type: none"> <li>• Disconnect all wiper motor connectors.</li> <li>• Check for:             <ul style="list-style-type: none"> <li>◆ corrosion.</li> <li>◆ pushed-out pins.</li> </ul> </li> <li>• Connect all wiper motor connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>	<p><b>Yes</b> INSTALL a new windshield wiper motor. REFER to <u>Wiper Motor</u> in this section.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.</p>

### Pinpoint Test C: The High/Low Wiper Speeds Do Not Operate Correctly

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

**Normal Operation**

The windshield wiper motor receives open and ground inputs from the multifunction switch through circuits 56 (DB/OG), 58 (WH), 61 (YE/RD) and 63 (RD). When a wiper function is selected, the multifunction switch grounds 1 of several combinations of these 4 circuits. The windshield wiper motor interprets these ground signals and performs the action requested. The multifunction switch is grounded through circuit 57 (BK).

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Multifunction switch
- Windshield wiper motor

**PINPOINT TEST C: THE HIGH/LOW WIPER SPEEDS DO NOT OPERATE CORRECTLY**

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take												
<b>C1 CHECK THE MULTIFUNCTION SWITCH</b>													
<ul style="list-style-type: none"><li>• Ignition OFF.</li><li>• Disconnect: Multifunction Switch C202B.</li><li>• Carry out the Multifunction Switch component test.</li></ul> <p>Refer to Wiring Diagrams Cell <u>149</u> for component testing.</p> <ul style="list-style-type: none"><li>• <b>Does the multifunction switch pass the component test?</b></li></ul>	<p><b>Yes</b> GO to <u>C2</u> .</p> <p><b>No</b> INSTALL a new multifunction switch. REFER to <u>Section 211-05</u> .</p>												
<b>C2 CHECK CIRCUITS 56 (DB/OG), 61 (YE/RD) AND 63 (RD) FOR OPENS</b>													
<ul style="list-style-type: none"><li>• Disconnect: Windshield Wiper Motor C125.</li><li>• Measure the resistance between multifunction switch C202B harness side and windshield wiper motor C125 harness side using the following chart:</li></ul> <table border="1"><thead><tr><th>Multifunction Switch</th><th>Circuit</th><th>Windshield Wiper Motor</th></tr></thead><tbody><tr><td>C202B-1</td><td>61 (YE/RD)</td><td>C125-1</td></tr><tr><td>C202B-4</td><td>63 (RD)</td><td>C125-9</td></tr><tr><td>C202B-6</td><td>56 (DB/OG)</td><td>C125-10</td></tr></tbody></table>	Multifunction Switch	Circuit	Windshield Wiper Motor	C202B-1	61 (YE/RD)	C125-1	C202B-4	63 (RD)	C125-9	C202B-6	56 (DB/OG)	C125-10	<p><b>Yes</b> GO to <u>C3</u> .</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

C202B-4	63 (RD)	C125-9											
C202B-6	56 (DB/OG)	C125-10											

- Are the resistances less than 5 ohms?

### C3 CHECK CIRCUITS 56 (DB/OG), 61 (YE/RD) AND 63 (RD) FOR SHORTS

- Measure the resistance between ground and windshield wiper motor:
  - ◆ 125-1, circuit 61 (YE/RD), harness side.
  - ◆ 125-9, circuit 63 (RD), harness side.
  - ◆ 125-10, circuit 56 (DB/OG), harness side.

- Is the resistance greater than 10,000 ohms?

**Yes**  
GO to C4.

**No**  
REPAIR circuit in question. TEST for normal operation.

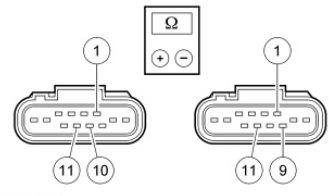

### C4 CHECK FOR SHORTS IN THE WINDSHIELD WIPER MOTOR HARNESS

- Measure the resistance at windshield wiper motor C125, harness side between the circuits shown in the following chart.

Windshield Wiper Motor	Circuits	Windshield Wiper Motor
C125-10	56 (DB/OG)/ 61 (YE/RD)	C125-1
C125-10	56 (DB/OG)/63 (RD)	C125-9
C125-10	56 (DB/OG)/58 (WH)	C125-11
C125-11	58 (WH)/61 (YE/RD)	C125-1
C125-11	58 (WH)/63 (RD)	C125-9
C125-1	61 (YE/RD)/63 (RD)	C125-9

**Yes**  
GO to C5.

**No**  
REPAIR the circuit. TEST the system for normal operation.

 <p>• Is the resistance greater than 10,000 ohms for all measurements?</p>	
<b>C5 CHECK FOR CORRECT WIPER MOTOR OPERATION</b>	
<ul style="list-style-type: none"> <li>• Disconnect all wiper motor connectors.</li> <li>• Check for: <ul style="list-style-type: none"> <li>◆ corrosion.</li> <li>◆ pushed-out pins.</li> </ul> </li> <li>• Connect all wiper motor connectors and make sure they seat correctly.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>	<p><b>Yes</b> INSTALL a new windshield wiper motor. REFER to <u>Wiper Motor</u> in this section.</p> <p><b>No</b> The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.</p>

### Pinpoint Test D: The Intermittent Wiper Speed Does Not Operate Correctly

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

#### Normal Operation

The windshield wiper motor receives open and ground inputs from the multifunction switch through circuits 56 (DB/OG), 58 (WH), 61 (YE/RD) and 63 (RD). When a wiper function is selected, the multifunction switch grounds 1 of several combinations of these 4 circuits. The windshield wiper motor interprets these ground signals and performs the action requested. The multifunction switch is grounded through circuit 57 (BK).

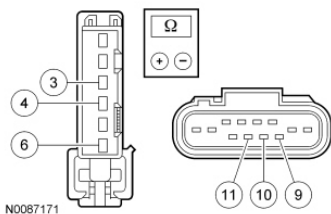

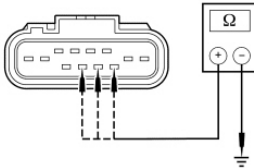

#### This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- Windshield wiper motor

### PINPOINT TEST D: THE INTERMITTENT WIPER SPEED DOES NOT OPERATE CORRECTLY

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>D1 CHECK THE MULTIFUNCTION SWITCH</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Multifunction switch C202b.</li> <li>• Carry out the Multifunction Switch component test.</li> </ul>	<p><b>Yes</b> GO to <u>D2</u> .</p> <p><b>No</b> INSTALL a new multifunction</p>

Refer to Wiring Diagrams Cell <u>149</u> for component testing. • <b>Does the multifunction switch pass the component test?</b>	switch. REFER to <u>Section 211-05</u> .												
<b>D2 CHECK CIRCUITS 56 (DB/OG), 58 (WH) AND 63 (RD) FOR OPENS</b>													
<ul style="list-style-type: none"><li>• Disconnect: Windshield Wiper Motor C125.</li><li>• Measure the resistance between multifunction switch C202B harness side and windshield wiper motor C125 harness side using the following chart:</li></ul> <table border="1"><thead><tr><th>Multifunction Switch</th><th>Circuit</th><th>Windshield Wiper Motor</th></tr></thead><tbody><tr><td>C202B-3</td><td>58 (WH)</td><td>C125-11</td></tr><tr><td>C202B-4</td><td>63 (RD)</td><td>C125-9</td></tr><tr><td>C202B-6</td><td>56 (DB/OG)</td><td>C125-10</td></tr></tbody></table>  <p>N0087171</p> <ul style="list-style-type: none"><li>• <b>Are the resistances less than 5 ohms?</b></li></ul>	Multifunction Switch	Circuit	Windshield Wiper Motor	C202B-3	58 (WH)	C125-11	C202B-4	63 (RD)	C125-9	C202B-6	56 (DB/OG)	C125-10	<p><b>Yes</b> GO to <u>D3</u> .</p> <p><b>No</b> REPAIR the circuit. <b>D3 CHECK CIRCUITS 56 (DB/OG), 58 (WH) AND 63 (RD) FOR A SHORT TO GROUND</b>													
<ul style="list-style-type: none"><li>• Measure the resistance between ground and windshield wiper motor:<ul style="list-style-type: none"><li>◆ 125-9, circuit 63 (RD), harness side.</li><li>◆ 125-10, circuit 56 (DB/OG), harness side.</li><li>◆ 125-11, circuit 58 (WH), harness side.</li></ul></li></ul>  <p>N0058187</p> <ul style="list-style-type: none"><li>• <b>Is the resistance greater than 10,000 ohms?</b></li></ul>	<p><b>Yes</b> GO to <u>D4</u> .</p> <p><b>No</b> REPAIR the circuit(s) in question. TEST the system for normal operation.</p>												
<b>D4 CHECK FOR SHORTS IN THE WINDSHIELD WIPER MOTOR HARNESS</b>													

- Measure the resistance at windshield wiper motor C125, harness side, between the circuits shown in the following chart.

Windshield Wiper Motor	Circuits	Windshield Wiper Motor
C125-10	56 (DB/OG)/ 61 (YE/RD)	C125-1
C125-10	56 (DB/OG)/63 (RD)	C125-9
C125-10	56 (DB/OG)/58 (WH)	C125-11
C125-11	58 (WH)/61 (YE/RD)	C125-1
C125-11	58 (WH)/63 (RD)	C125-9
C125-1	61 (YE/RD)/63 (RD)	C125-9

- Is the resistance greater than 10,000 ohms for all measurements?

**Yes**GO to **D5**.**No**

REPAIR the circuit. TEST the system for normal operation.

#### **D5 CHECK FOR CORRECT WIPER MOTOR OPERATION**

- Disconnect all wiper motor connectors.
- Check for:
  - ◆ corrosion.
  - ◆ pushed-out pins.
- Connect all wiper motor connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- Is the concern still present?

**Yes**INSTALL a new windshield wiper motor. REFER to Wiper Motor in this section.**No**

The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

#### **Pinpoint Test E: The Washer Pump is Inoperative**

Refer to Wiring Diagrams Cell **81**, Wipers and Washers for schematic and connector information.

**Normal Operation**

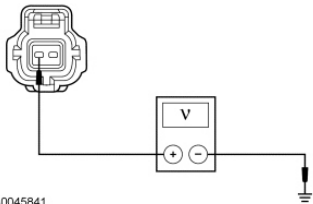

When the wash function is selected by the operator, the multifunction switch grounds circuit 680 (LB/OG) to the windshield wiper motor. The windshield wiper motor interprets this ground signal and energizes the internal washer relay. Voltage is sent to the washer pump from the windshield wiper motor through circuit 941 (BK/WH). The windshield washer pump motor is grounded through circuit 57 (BK). The multifunction switch is grounded through circuit 57 (BK).

**This pinpoint test is intended to diagnose the following:**

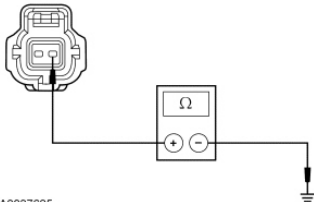

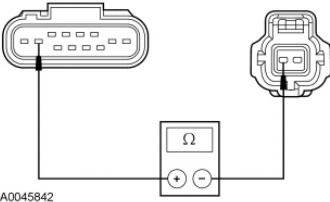

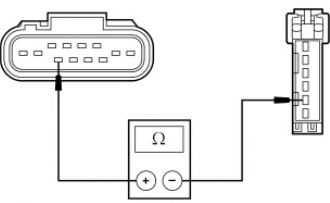

- Wiring, terminals or connectors
- Multifunction switch
- Windshield washer pump
- Windshield wiper motor

**PINPOINT TEST E: THE WASHER PUMP IS INOPERATIVE**

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
<b>E1 CHECK THE WASHER PUMP MOTOR FOR VOLTAGE</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: Windshield Washer Pump C137.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between windshield washer pump C137-1, circuit 941 (BK/WH), harness side and ground while depressing the multifunction switch to the wash position.</li> </ul>  <p>A0045841</p> <ul style="list-style-type: none"> <li>• Is the voltage greater than 10 volts?</li> </ul>	<p><b>Yes</b> GO to <u>E2</u> .</p> <p><b>No</b> GO to <u>E3</u> .</p>
<b>E2 CHECK CIRCUIT 57 (BK) FOR GROUND</b>	
<ul style="list-style-type: none"> <li>• Measure the resistance between the windshield washer pump C137-2, circuit 57 (BK), harness side and ground.</li> </ul>	<p><b>Yes</b> INSTALL a new windshield washer pump. REFER to <u>Washer Pump and Reservoir</u> in this section.</p> <p><b>No</b> REPAIR the circuit. TEST the system for normal operation.</p>

TEST the system for normal operation.</p>

---

### Wiper Blade and Pivot Arm Adjustment

1. Cycle and park the windshield wipers.
2. Verify that the RH and LH wiper blades are located at the specified position.

3. **NOTE:** Make sure there is no mechanical binding in the linkage preventing the wiper arms from returning to the fully parked position.

If not within the specification, remove the wiper pivot arms and reposition to the correct location. For additional information, refer to Wiper Pivot Arm in this section.

---

**Wiper and Washer System - Exploded View**

Item	Part Number	Description
1	17527	Wiper pivot arms (2 required)
2	N620479-S	Evaporative emission canister purge valve nuts (2 required)
3	9C915	Evaporative emission canister purge valve
4	N610021-S	Wiper mounting arm and pivot shaft bolts (6 required)
5	17566	Wiper mounting arm and pivot shaft
6	-	Windshield wiper motor electrical connector (part of 14290)
7	-	Windshield wiper motor cover (part of 17566)
8	N605771-S	Windshield wiper motor bolts (3 required)
9	17504	Windshield wiper motor

1. For additional information, refer to the procedures in this section.

---

## Wiper Pivot Arm

### Removal and Installation

1. **NOTE:** To gain additional clearance, activate the wipers and cycle the key OFF when the wipers reach their highest point on the windshield.

Lift the wiper pivot arm to the full upright position.

2. Release the locking tab and remove the wiper pivot arm.

3. **NOTE:** During installation, it is necessary to pull the locking tab out to its full open (unlatched) position and hold while assembling the pivot arm onto the mounting arm and pivot shaft. Align the key on the pivot arm head with the keyway on the shafts. This makes sure the pivot arm is correctly aligned. If necessary, the keyway can be removed. To adjust the wiper pivot arms, refer to Wiper Blade and Pivot Arm Adjustment in this section.

To install, reverse the removal procedure.

---

## **Wiper Mounting Arm and Pivot Shaft**

### **Removal and Installation**

1. Remove the cowl panel grille. For additional information, refer to Section 501-02 .
  2. Remove the 2 nuts and position the evaporative emission canister purge valve aside.
    - To install, tighten to 6 Nm (53 lb-in).
  3. Remove the 6 bolts and position the wiper mounting arm and pivot shaft aside.
    - To install, tighten to 12 Nm (106 lb-in).
  4. Disconnect the 2 harness pushpins and the windshield wiper motor electrical connector.
  5. Disconnect the windshield washer hose and remove the wiper mounting arm and pivot shaft.
  6. Remove the wiper motor assembly. For additional information, refer to Wiper Motor in this section.
  7. To install, reverse the removal procedure.
-

---

## Wiper Motor

### Removal and Installation

**NOTE:** A new wiper motor assembly comes with the linkage arm installed.

1. Remove the windshield wiper motor cover.
2. **NOTE:** If the wiper motor is inoperative, manually rotate the wiper motor linkage until the wipers reach their highest point on the windshield.

Remove the wiper mounting arm and pivot shaft assembly. For additional information, refer to Wiper Mounting Arm and Pivot Shaft in this section.

3. **NOTICE:** Do not remove the wiper motor linkage arm from the wiper motor assembly. If the arm is removed, the wiper arms may not park in the correct location.

Separate the wiper motor linkage arm from the wiper mounting arm and pivot shaft assembly.

- Use a suitable tool at the location shown to separate the wiper linkage arm from the wiper mounting arm and pivot shaft assembly.

4. Remove the 3 bolts and remove the windshield wiper motor.
  - To install, tighten to 13 Nm (115 lb-in).

5. To install, reverse the removal procedure.
-

**Washer Pump and Reservoir**

## Material

Item	Specification
Motorcraft® Premium Windshield Washer Concentrate (US) ZC-32-A or B (US)	WSB-M8B16-A2
Motorcraft® Premium Quality Windshield Washer Fluid (Canada) CXC-37-(A, B, D, and F) (Canada)	-

Item	Part Number	Description
1	-	Windshield washer pump reservoir bolts (2 required)
2	17618	Windshield washer pump reservoir
3	17664	Windshield washer pump
4	-	Windshield washer pump electrical connector (part of 14290)
5	-	Washer fluid level switch electrical connector (part of 14290)
6	17K605	Windshield washer hose

**Removal and Installation**

1. Remove the air cleaner assembly. For additional information, refer to [Section 303-12](#).
2. Remove the 2 bolts and position the windshield washer pump and reservoir aside.

- To install, tighten to 6 Nm (53 lb-in).

3. Disconnect the electrical connectors.

4. **⚠ WARNING:** Carefully read cautionary information on product label. For **EMERGENCY MEDICAL INFORMATION** seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

**NOTE:** Windshield washer fluid should be collected in a container after the windshield washer hose is disconnected.

Disconnect the windshield washer hose and remove the windshield washer pump and reservoir.

5. Remove the windshield washer pump from the reservoir.

6. **NOTICE:** Do not operate the windshield washer pump prior to filling the windshield reservoir. Failure to follow this instruction may result in premature pump failure.

To install, reverse the removal procedure.

---

**Torque Specifications**

<b>Description</b>	<b>Nm</b>	<b>lb-ft</b>	<b>lb-in</b>

---

**Bumper - Exploded View, Front**

Item	Part Number	Description
1	N808841	Lower radiator air deflector bolts (4 required)
2	N808841	Radiator vertical deflector bolts (2 required)
3	388577	Pin-type retainers (2 required)
4	390018	Front bumper cover pin-type retainers (6 required)
5	N808841	Front bumper cover bolt (2 required)
6	N800322	Front bumper cover-to-fender screw (2 required)
7	17D957	Front bumper cover
8	W701913	Front bumper isolator rivets (5 required)
9	17E898	Front bumper isolator
10	W505434	Front bumper bolts (8 required)
11	17750	Front bumper
12	W520513	Front bumper bracket nuts (4 required)
13	17752 RH/ 17753 LH	Front bumper brackets

1. For additional information, refer to the procedures in this section.

**Bumper Cover - Front****Removal and Installation**

1.  **WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

 **WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the 4 lower radiator air deflector bolts and the 2 radiator vertical deflector bolts.
    - To install, tighten to 7 Nm (62 lb-in).
  3. Remove the 2 pin-type retainers (1 each side).
  4. Remove the 6 front bumper cover pin-type retainers (3 each side).
  5. Remove the side turn signal lamp assemblies. For additional information, refer to [Section 417-01](#) .
  6. Remove the 2 front bumper cover screws (1 each side).
    - To install, tighten to 7 Nm (62 lb-in).
  7. Remove the 2 front bumper cover-to-fender screws (1 each side).
    - To install, tighten to 2 Nm (18 lb-in).
  8. If equipped, disconnect the fog lamp electrical connectors and remove the front bumper cover.
  9. To install, reverse the removal procedure.
-

## Bumper Isolator - Front

### Special Tool(s)

	<p>Heavy-Duty Riveter 501-D011 (D80L-23200-A) or equivalent</p>
---	---

### Removal and Installation

1. Remove the front bumper cover. For additional information, refer to Bumper Cover - Front in this section.
2. Remove the 5 front bumper isolator rivets and the 2 front bumper isolator halves.
3. To install, reverse the removal procedure.
  - Use the Heavy-Duty Riveter to install the new rivets.

## **Bumper - Front**

### **Removal and Installation**

1. Remove the front bumper isolator. For additional information, refer to Bumper Isolator - Front in this section.
  2. Remove the 8 front bumper bolts (4 each side) and the front bumper.
    - To install, tighten to 25 Nm (18 lb-ft).
  3. To install, reverse the removal procedure.
-

## **Bumper Bracket - Front**

### **Removal and Installation**

1. Remove the front bumper. For additional information, refer to Bumper Isolator - Front in this section.
  2. Remove the 8 front bumper bracket nuts (4 each side), front bumper brackets and the front bumper bracket plates.
    - To install, tighten to 30 Nm (22 lb-ft).
  3. To install, reverse the removal procedure.
-

**Bumper - Exploded View, Rear**

Item	Part Number	Description
1	W707938	Rear bumper cover screws (2 required)
2	W707938	Rear bumper cover screws (2 required)
3	388930	Rear bumper cover pin-type retainers (2 required)
4	390018	Rear bumper cover pin-type retainers (6 required)
5	N621927	Rear bumper cover nuts (4 required)
6	N621927	Rear bumper cover nuts (6 required)
7	17K835	Rear bumper cover
8	W709361	Rear bumper nuts (4 required)
9	17775	Rear bumper
10	N800169	Rear bumper bracket nuts (2 required)
11	N811799	Rear bumper bracket bolts (2 required)
12	17D788 RH/ 17D864 LH	Rear bumper brackets

1. For additional information, refer to the procedures in this section.

---

**Bumper Cover - Rear****Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B**. Failure to follow the instructions may result in serious personal injury.

Depower the fire suppression system, if equipped. For additional information, refer to **Section 100-02B**.

2. **⚠ WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **Section 100-02A**.

3. Remove the 2 rear bumper cover screws.
4. Remove the 2 rear bumper cover screws and the 2 rear bumper cover pin-type retainers (1 each side).
5. Remove the 6 rear bumper cover pin-type retainers (3 each side).
6. Remove the pin-type retainers and the luggage compartment rear trim panel.
  - Position the luggage compartment lining material aside.

7. Remove the 4 rear bumper cover nuts (2 each side).
    - To install, tighten to 7 Nm (62 lb-in).
  8. Remove the 6 rear bumper cover nuts (3 each side) and the rear bumper cover.
    - To install, tighten to 7 Nm (62 lb-in).
  9. To install, reverse the removal procedure.
-

---

**Bumper - Rear**

Special Tool(s)

**Removal and Installation**

**⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

1. Remove the rear bumper cover. For additional information, refer to Bumper Cover - Rear in this section.
  2. Remove the 4 rear bumper nuts (2 each side) and the rear bumper.
    - To install, tighten to 40 Nm (30 lb-ft).
  3. If necessary, remove the 2 rear bumper cover brackets and rivets.
  4. To install, reverse the removal procedure.
    - Use the Heavy-Duty Riveter to install the new rivets.
-

## Bumper Bracket - Rear

### Removal

**NOTICE:** Never apply heat to the bumper isolator and bracket. Heat could cause the material inside the bumper isolator and bracket to expand and leak. Heat may also crack the metal housing. Always remove the bumper isolator and bracket before carrying out body frame service near them.

1. Remove the rear bumper. For additional information, refer to Bumper - Rear in this section.
2. **NOTE:** LH shown, RH similar.

Remove the bolt and the rear bumper bracket.

### Installation

1. Inspection must be made prior to reusing the bumper isolator and bracket. If the bumper isolator and bracket do not meet any one of the inspection criteria listed below, install a new bumper isolator and bracket.
    - There must be no visible fluid leaks.
    - There must be no deformation to the inner or outer cylinders.
    - At ambient temperatures, the outer cylinder must not turn (by hand), relative to the inner cylinder.
    - Place the bumper isolator and bracket in an arbor press or an equivalent press mechanism, and stroke the bumper isolator and bracket approximately 13 mm (1/2 in) to determine whether it returns to its original length. If it does not return to its original length, it must be replaced. A bumper isolator and bracket that does not return to its original length may have developed loss of pressure or fluid that would prevent it from functioning correctly in subsequent impacts.
    - Minor straightening of the bumper isolator and bracket is permissible, provided there are no visible leaks and the bumper isolator and bracket function correctly.
  2. Install the rear bumper bracket and bolt.
    - Tighten to 90 Nm (66 lb-ft).
  3. Install the rear bumper. For additional information, refer to Bumper - Rear in this section.
-

**Torque Specifications**

Description	Nm	lb-ft	lb-in
<b>Front Safety Belts</b>			
D-ring bolt	40	30	-
Safety belt anchor bolt	40	30	-
Safety belt buckle nut (driver and passenger)	48	35	-
Safety belt retractor and pretensioner bolt	40	30	-
Safety belt shoulder height adjuster bolts	40	30	-

Safety belt retractor bolt	40	30	-

---

## Safety Belt System

**⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

When installing new safety belt buckles and/or retractor assemblies, use only the replacement parts specified in the Ford Customer Service Division Master Parts and Accessories Catalog.

## Active Restraint System Components

The active restraint system consists of the following serviceable items:

- Safety belt shoulder height adjusters attached to the LH and RH B-pillars
- Front safety belt retractors attached to the LH and RH B-pillars
- Rear LH and RH safety belt retractors attached to the body behind the quarter trim panels
- Rear center safety belt retractor attached to the body at the parcel shelf
- Front safety belt buckles attached to the driver and front passenger seat tracks
- Front center safety belt and buckle attached with the seat track rear inboard mounting fasteners on the driver and front passenger seats
- Rear safety belt buckles (LH, RH and center) attached to the floor pan underneath the rear seat cushion
- Child safety seat tether anchors attached to the parcel shelf
- Lower anchors and tethers for children attached to the floor pan underneath the rear seat cushion at the RH and LH rear seating positions

## Safety Belt Retractors

The safety belt retractors consist of the following features:

- Safety belt pretensioner (front only)
- Dual locking mode
  - ◆ Emergency Locking Retractor (ELR)
  - ◆ Automatic Locking Retractor (ALR) (all except driver seat)

### **Safety Belt Retractor and Pretensioner**

The front safety belt retractors are equipped with pretensioners that operate as part of the Supplemental Restraint System (SRS). The pretensioner is a pyrotechnic device that deploys when activated by the Restraints Control Module (RCM) to remove excess safety belt webbing from the shoulder and lap safety belt in the event of an impact. If a deployment of the safety belt retractor and pretensioners occurs, a new assembly must be installed. Refer to Safety Belt Retractor and Pretensioner in this section.

For safety belt retractor and pretensioner diagnostic and disposal information, refer to Section 501-20B .

### **Emergency Locking Retractor (ELR)**

Every safety belt retractor is a 3-point restraint with the ELR feature. The safety belt retractor is designed to allow the occupant freedom of movement in normal operation. The ELR is a vehicle sensitive feature designed to activate and lock the safety belt webbing when braking hard, cornering hard or in an impact of approximately 8 km/h (5 mph). The ELR feature helps to reduce the forward movement of the driver and passengers. Refer to the appropriate Functional Test procedure in Safety Belt System in this section.

### **Automatic Locking Retractor (ALR)**

The ALR mode is used when locking a child seat in an outboard seating position or when a tight belt fit is desired. The ALR mode is automatically activated when the safety belt webbing is fully extracted from the retractor and then allowed to retract. As the safety belt webbing is retracted back onto the spool, an audible clicking sound is made indicating the safety belt retractor is in ALR mode and the safety belt webbing will not pull back out of the safety belt retractor. To disengage the ALR mode, allow the safety belt webbing to fully retract back onto the spool. The ALR mode is disengaged when the webbing is free to extract and retract back into the retractor. Refer to the appropriate Functional Test procedure in Safety Belt System in this section.

### **Safety Belt Buckles**

#### **Front Safety Belt Buckles**

The front outboard seat safety belt buckles are attached to the front seat tracks and can be serviced separately. The center safety belt and safety belt buckle are attached to the front seat inboard mounting studs and are also serviced separately.

#### **Belt Tension Sensor (BTS)**

The Belt Tension Sensor (BTS) is part of the passenger front safety belt buckle and can only be serviced with a new passenger safety belt buckle. The BTS operates as part of the Occupant Classification Sensor (OCS) system on the front passenger seat. To diagnose the BTS or OCS system, refer to Section 501-20B .

#### **Rear Safety Belt Buckles**

The rear seat safety belt buckles are attached to the floor pan behind the rear seat cushion and can be serviced separately.

### **Child Safety Seat Restraints**

The child safety seat restraints include the following serviceable items:

- Child safety seat tether anchors located at all rear seating positions, attached to the parcel shelf
- Lower anchors and tethers for children attachments located at the outboard seating positions, mounted to the floor pan behind the rear seat cushion

If a child safety seat was in use during a collision, inspect the vehicle portion of the system for damage. Inspect the vehicle structure at the child safety seat component mounting areas and repair any damage to the original production configuration.

---

---

## Safety Belt System

### Principles of Operation

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

### Safety Belt Warning System

The conditions of operation for the driver safety belt warning indicator and chime are as follows:

- If the driver safety belt is not buckled before the ignition switch is turned to RUN, then the safety belt warning indicator illuminates for 1 to 2 minutes and the warning chime sounds for 4 to 8 seconds.
- If the driver safety belt is buckled while the warning indicator is illuminated and the warning chime is sounding, then the safety belt warning indicator and warning chime turn off.
- If the driver safety belt is buckled before the ignition switch is turned to ON, the safety belt warning indicator and warning chime will remain off.

### Belt-Minder®

The Belt-Minder® feature is a supplemental warning to the safety belt warning function. This feature provides an additional reminder to the driver that the driver and/or front passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning indicator in the Instrument Cluster (IC) module.

Either the driver or front passenger safety belt systems may activate the Belt-Minder®. If the Belt-Minder® warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder® feature.

The passenger Belt-Minder® feature is activated only when the Occupant Classification Sensor (OCS) system detects a passenger in the right front seat and the passenger weight exceeds a programmed limit. For information on the OCS system, refer to [Section 501-20B](#) .

To activate or deactivate the Belt-Minder® feature, refer to [Section 413-01](#) .

If...	Then...
the driver and/or front passenger safety belt is buckled before the ignition switch is turned to the ON position or less than 1-2 minutes have elapsed since the ignition switch has been turned ON...	the Belt-Minder® feature will not activate.
the driver and/or front passenger safety belt is not buckled before the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition switch has been turned to ON...	the Belt-Minder® feature is activated - the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belt(s) is buckled.
the driver or front passenger safety belt becomes unbuckled for approximately 1 minute while the vehicle is traveling at least 5 km/h (3 mph) and more than 1-2 minutes have elapsed since the ignition switch has been turned to ON...	the Belt-Minder® feature is activated - the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belt(s) is buckled.

### Inspection and Verification

**⚠ WARNING:** If equipped with fire suppression system, refer to [Section 100-02B](#) for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

1. Verify the customer concern by operating the active restraint system to duplicate the condition.
2. Inspect to determine if any of the following mechanical or electrical concerns apply:

### Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Safety belt webbing integrity (torn, frayed, cut or stretched)</li> <li>• Safety belt buckle and tongue assembly</li> <li>• Safety belt retractor</li> </ul>	<ul style="list-style-type: none"> <li>• Bare, broken or disconnected wire</li> <li>• Connector not tightly engaged</li> <li>• Safety belt warning indicator burned out or broken</li> </ul>

3. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. With the exception of removing a twist from the safety belt webbing, do not attempt to repair a component of the safety belt system; new components must be installed.
4. If the concern remains after the inspection, determine the symptom. GO to [Symptom Chart](#) .

5. To check the active restraint system for correct operation, carry out the appropriate Functional Test procedure(s). Refer to Component Test in this section.

## Symptom Chart

Symptom Chart

## Component Test

**⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

Carry out the appropriate Functional Test procedure(s) as determined in Inspection and Verification.

## Functional Test - Safety Belt Buckle and Tongue

The safety belt buckle and tongue assembly must operate freely during the latching and unlatching function. Fasten the safety belt by inserting the tongue (male portion) into the buckle (female portion).

1. Verify the following during the latching sequence:
  - Tongue insertion is not hindered by excessive effort.
  - A click is heard when the safety belt buckle latches the tongue.
2. Verify the system integrity by forcefully pulling on the safety belt webbing.
3. Unlatch the safety belt by fully depressing the safety belt buckle release button and allowing the safety belt to release and retract.
4. Verify the following during the unlatching process:
  - Push-button depression does not require excessive effort.

- The tongue can be removed easily from the buckle.
5. Repeat the above steps 3 times.
  6. If the functional test reveals a concern(s), install a new safety belt buckle or safety belt retractor as required.

### **Functional Test - Safety Belt Retractor**

The safety belt retractor must be freely operational for extraction and retraction of the safety belt webbing between full extension and in-vehicle stowed positions.

1. Extract and retract the safety belt between the full extension and stowed positions.
2. Verify the safety belt retractor operates without excessive effort or binding.
3. Install a new safety belt retractor if any concern is found or the complaint has been verified.

### **Functional Test - Safety Belt Retractor, Automatic Locking Retractor (ALR) Mode**

1. Position the seat backrest fully upright (if adjustable).
2. Position the safety belt shoulder height adjuster (if equipped) in the full down or up position.
3. Fasten the safety belt.
4. Pull out the safety belt webbing until the Automatic Locking Retractor (ALR) feature is activated.
5. Allow the safety belt webbing to retract until it stops.
6. Pull on the safety belt webbing to check that the safety belt retractor has remained in the ALR mode.  
If the safety belt retractor is not locked, install a new safety belt retractor.
7. Unfasten the safety belt and allow the safety belt webbing to retract to its stowed position.
8. Pull out and retract the safety belt webbing to verify the safety belt retractor has converted automatically out of ALR mode. If the safety belt retractor remains locked in the ALR mode, install a new safety belt retractor.

### **Functional Test - Safety Belt Retractor, Road Test Inspection**

**⚠ WARNING: The driver and passenger must be prepared to brace themselves in the event the safety belt retractor does not lock. Failure to follow this instruction may result in serious personal injury.**

**NOTE:** Make sure there is no excessive slack in the safety belt webbing across the torso during testing.

**NOTE:** Do not jerk on the safety belt webbing when carrying out this test.

1. Test the safety belts in the following sequence:
  1. Fasten the safety belts and proceed to a safe area.
  2. Attain a speed of 24 km/h (15 mph).

3. **⚠ WARNING: Apply maximum brake force only on dry concrete or equivalent hard surface, NEVER on wet pavement or gravel. Failure to follow this instruction may result in serious personal injury.**

Grasp the shoulder harness, lean forward and apply the brakes, making a maximum braking application without a skid.

4. The safety belts should lock up with minimum webbing extension.
  5. If there is a lockup of all safety belt retractors being tested, the safety belt retractors are functioning correctly. If any safety belt retractor fails to lock up, install a new safety belt retractor(s).
-

### Safety Belt Cleaning

1.  **WARNING: Do not bleach or re-dye the safety belt webbing, as the webbing may weaken. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.**

Clean the safety belt webbing only with a mild soap solution recommended for cleaning upholstery or carpets. Follow the instructions provided with the soap.

---

---

## Safety Belt Maintenance

**⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. The safety belt assemblies should be periodically inspected to make sure that they have not become damaged and that they remain in correct operating condition, particularly if they have been subjected to severe stress.
  2. Before installing the new safety belt assembly, the safety belt retaining areas must be inspected for damage and distortion. If the retaining points are damaged and distorted, the sheet metal must be reworked back to its original shape and structural integrity.
  3. Install the new safety belt(s) using the appropriate instructions. Carry out the appropriate Functional Test Procedure. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System , Component Test, in this section.
-

---

**Safety Belt Procedure After a Collision**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Before installing a new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be worked back to its original shape and structural integrity.
  2. Install the new safety belt(s). For additional information, refer to the appropriate procedure in this section. Carry out all applicable Functional Tests for the component(s). For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.
-

### Safety Belt Tongue Rotated on Belt

1. Grasp the belt tongue and pull the belt webbing down to form a loop through the slot in the tongue.

2. Rotate and fold the belt webbing over itself within the slot to remove the twist.
3. Pull the excess belt webbing back through the slot in the belt tongue.
4. Pull the excess belt webbing through the slot.
5. The safety belt tongue should face inward when completed.

### **Safety Belt Twisted at the Safety Belt Guide**

**NOTE:** Typical D-ring shown, others similar.

1. Grasp the belt webbing at the shoulder belt guide (D-ring).
2. Rotate and fold the belt webbing over itself to remove the twist.
3. Feed the folded portion of the belt through the safety belt guide (D-ring).

**Child Safety Seat Tether Anchor**

Item	Part Number	Description
1	W506423	Child safety seat tether anchor bolts
2	613D74	Child safety seat tether anchors

**Removal and Installation**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B. Failure to follow the instructions may result in serious personal injury.

For police vehicles equipped with fire suppression, depower the fire suppression system.

2. Remove the parcel shelf. For additional information, refer to [Section 501-05](#) .
3. Remove the bolt and child safety seat tether anchor.
  - To install, tighten to 25 Nm (18 lb-ft).
4. **⚠ WARNING: Always tighten the child safety seat tether anchor/bolt to specification. Failure to follow this instruction may result in the child's safety seat being incorrectly secured, which increases the risk of serious personal injury or death to the child in a sudden stop or crash.**

To install, reverse the removal procedure.

5. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.**

For police vehicles equipped with fire suppression, repower the fire suppression system.

6. Check the active restraints for correct operation. For additional information, refer to the appropriate Functional Test procedure in [Safety Belt System](#) in this section.
-

**Child Safety Seat Tether Anchor - LATCH****NOTE:** RH shown, LH similar.

Item	Part Number	Description
1	W707079	Lower anchors and tethers for children bolts (2 required)
2	601B28	Lower anchors and tethers for children

**Removal and Installation**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

**NOTE:** No attempt should be made to repair the lower anchors and tethers for children. Install a new part if damage is verified.

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

For police vehicles equipped with fire suppression, depower the fire suppression system.

2. Remove the rear seat cushion. For additional information, refer to Section 501-10 .
3. **⚠ WARNING:** Always tighten the child safety seat tether anchor/bolt to specification. Failure to follow this instruction may result in the child's safety seat being incorrectly secured, which increases the risk of serious personal injury or death to the child in a sudden stop or crash.

Remove the 2 bolts and slide the lower anchors and tethers for children out through the opening in the carpet.

- To install, tighten to 18 Nm (159 lb-in).
  - For installation, make sure the lower anchors and tethers for children is accessible and the alignment tabs are inserted into the slots in the floor pan sheet metal with the wire attachments at the top.
4. **NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.

5. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

For police vehicles equipped with fire suppression, repower the fire suppression system.

6. Check the active restraints for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.
-

**Safety Belt Buckle - Front, Center**

Item	Part Number	Description
1	N621945	Seat track-to-floor nut, inboard
2	611B76	Center safety belt
3	-	Seat track

**Removal and Installation**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

**NOTE:** The front center safety belt and tongue is mounted on the driver seat inboard rear mounting stud. Removal of the center safety belt buckle on the passenger front seat is similar. The front center safety belt and tongue is shown.

1. Position the seat to access the fasteners.
2. Remove the 2 seat track front covers.
3. Remove the 2 seat track-to-floor bolts.
  - To install, tighten to 25 Nm (18 lb-ft).

4. Remove the 2 seat track rear covers.
5. Remove the 2 seat track-to-floor nuts.
  - To install the inboard nut, tighten to 80 Nm (59 lb-ft).
  - To install the outboard nut, tighten to 25 Nm (18 lb-ft).

6. Tilt the seat forward enough to separate the front center safety belt and tongue anchor from the mounting stud and seat.
  - For installation, make sure the safety belt anchor is in place on the rear inboard stud before tightening the nut.
7. Route the safety belt and tongue through the seat cushion opening and remove the assembly.
8. **NOTE:** Make sure the safety belt webbing is not twisted and the safety belt and buckles are accessible to the occupants.

To install, reverse the removal procedure.

9. Check the active restraints for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

**Safety Belt Buckle - Front****NOTE:** LH shown, RH similar.**NOTE:** Seat backrest and armrest removed for clarity.

Item	Part Number	Description
1	61202 RH/ 61203 LH	Front safety belt buckle
2	-	Electrical connector
3	-	Front safety belt buckle nut

**Removal**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

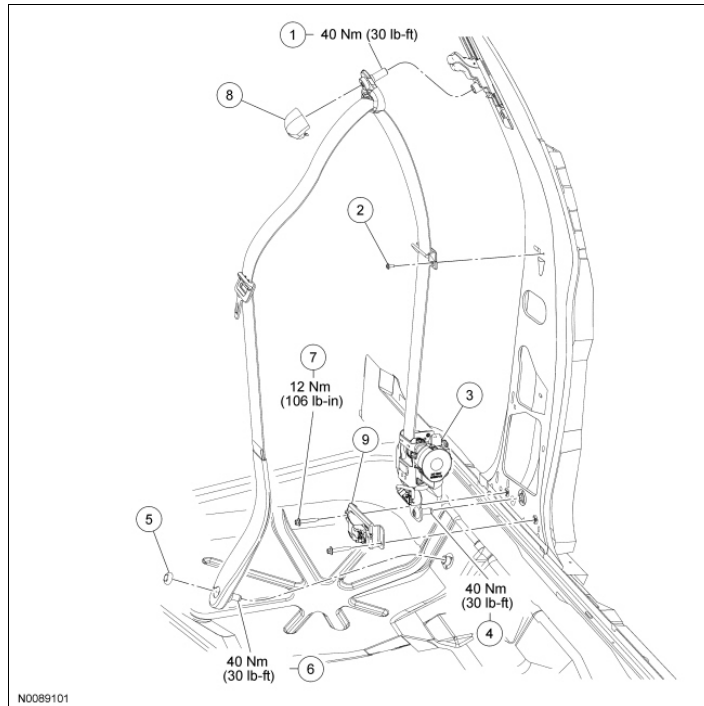

1. **⚠ WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

Turn the ignition OFF and wait one minute to deplete the backup power supply.

2. Looking under the front seat from the second row, position the affected safety belt buckle nut in the indentation of the transmission tunnel. If equipped with power seats, position the seat all the way up.
3. Position the other seat all the way forward.
4. Disconnect the electrical connector.
5. Remove the nut and front safety belt buckle.
  - Route the front safety belt buckle out from the seat cushion opening.
  - To install, tighten to 48 Nm (35 lb-ft).
6. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.

7. Check the active restraints for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.
-

**Safety Belt Retractor and Pretensioner****NOTE:** LH shown, RH similar.

Item	Part Number	Description
1	-	D-ring bolt (part of 611B08 RH/ 611B09 LH)
2	W710123	Secondary safety belt guide screw
3	611B08 RH/ 611B09 LH	Safety belt retractor and pretensioner
4	-	Safety belt retractor and pretensioner bolt (part of 611B08 RH/611B09 LH)
5	611B32	Safety belt anchor cover
6	-	Safety belt anchor bolt (part of 611B08 RH/ 611B09 LH)
7	W707935	Side impact sensor bolt (part of 14B345) (2 required)
8	60262	D-ring cover
9	14B345	Side impact sensor

**Removal**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)

- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners or adaptive load limiting retractors or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors which increases the risk of serious personal injury or death.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
2. **NOTE:** Inspect the D-ring cover for damage. If the cover is damaged or does not remain closed, install a new D-ring cover.  
  
Release the 2 tabs and open the D-ring cover.
3. Remove the bolt and D-ring.
4. Remove the safety belt anchor bolt cover.
5. Remove the bolt and safety belt anchor.
6. Remove the upper and lower B-pillar trim panels. For additional information, refer to Section 501-05 .
7. Remove the secondary safety belt guide screw.
8. **NOTE:** The side impact sensor bolts must be removed in the sequence shown.

Disconnect the electrical connectors and remove the side impact sensor.

1. Disconnect the electrical connector.
2. Remove the bolt.

3. Remove the bolt.
4. Remove the side impact sensor.
5. Disconnect the pretensioner electrical connector.

9. Remove the bolt and safety belt retractor and pretensioner assembly.

## Installation

**NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

1. Install the safety belt retractor and pretensioner and bolt.
  - Tighten to 40 Nm (30 lb-ft).
2. Connect the pretensioner electrical connector.
3. **⚠ WARNING:** Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

**NOTE:** The side impact sensor bolts must be installed in the sequence shown.

Install the side impact sensor with bracket.

1. Position the side impact sensor with bracket.
2. Install the bolt.
  - ◆ Tighten to 12 Nm (106 lb-in).
3. Install the bolt.
  - ◆ Tighten to 12 Nm (106 lb-in).
4. Connect the electrical connector.

4. Install the secondary safety belt guide screw.

5. Install the upper and lower B-pillar trim panels. For additional information, refer to Section 501-05 .
  6. Install the safety belt anchor and bolt.
    - Tighten to 40 Nm (30 lb-ft).
  7. Install the safety belt anchor bolt cover.
  8. Install the D-ring and bolt.
    - Tighten to 40 Nm (30 lb-ft).
  9. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
  10. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.
-

**Safety Belt Retractor - Rear, Center**

Item	Part Number	Description
1	-	Safety belt retractor bolt (part of 600A38)
2	600A38	Safety belt retractor
3	N800937	Safety belt anchor nut

**Removal and Installation**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious

personal injury or death in a crash.

1. **⚠ WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.**

For police vehicles equipped with fire suppression, depower the fire suppression system.

2. Remove the rear seat (cushion and backrest). For additional information, refer to Section 501-10 .
3. Disengage the safety belt from the bezel and remove the parcel shelf. For additional information, refer to Section 501-05 .
4. Remove the nut and safety belt anchor.
  - To install, tighten to 55 Nm (41 lb-ft).
5. Remove the bolt and safety belt retractor.
  - To install, tighten to 40 Nm (30 lb-ft).
  - For installation, engage the safety belt retractor anti-rotation tab to the package tray sheet metal.
6. **NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure

7. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

For police vehicles equipped with fire suppression, repower the fire suppression system.

8. Check the active restraints for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.
-

**Safety Belt Buckle - Rear**

Item	Part Number	Description
1	60044	Safety belt buckle assembly
2	N800937	Safety belt buckle nut

**Removal and Installation**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

**NOTE:** The RH safety belt buckle is a part of the rear center safety belt retractor assembly. For additional information, refer to Safety Belt Retractor - Rear, Center in this section.

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B. Failure to follow the instructions may result in serious personal injury.

For police vehicles equipped with fire suppression, depower the fire suppression system.

2. Remove the rear seat cushion. For additional information, refer to Section 501-10 .
3. Remove the nut and safety belt buckle assembly.
  - To install, tighten to 55 Nm (41 lb-ft).
4. **NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.

5. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

For police vehicles equipped with fire suppression, repower the fire suppression system.

6. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.
-

**Safety Belt Retractor - Rear****NOTE:** LH shown, RH similar.**NOTE:** Rear seat backrest is removed for clarity.

Item	Part Number	Description
1	-	Bolt, safety belt guide (part of 611B68 RH/611B69 LH)
2	-	Bolt, safety belt retractor (part of 611B68 RH/611B69 LH) (2 required)
3	611B68 RH/ 611B69 LH	Safety belt retractor
4	N800937	Rear seat backrest nut

**Removal and Installation**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt

pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. **⚠ WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.**

For police vehicles equipped with fire suppression, depower the fire suppression system.

2. Remove the parcel shelf. For additional information, refer to Section 501-05 .
3. Remove the 2 safety belt retractor bolts.
  - To install, tighten to 40 Nm (30 lb-ft).
4. Remove the bolt and safety belt guide.
  - To install, tighten to 40 Nm (30 lb-ft).
5. Remove the rear seat backrest nut and safety belt anchor.
  - To install, tighten to 55 Nm (41 lb-ft).
6. Remove the safety belt retractor.
7. **NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.

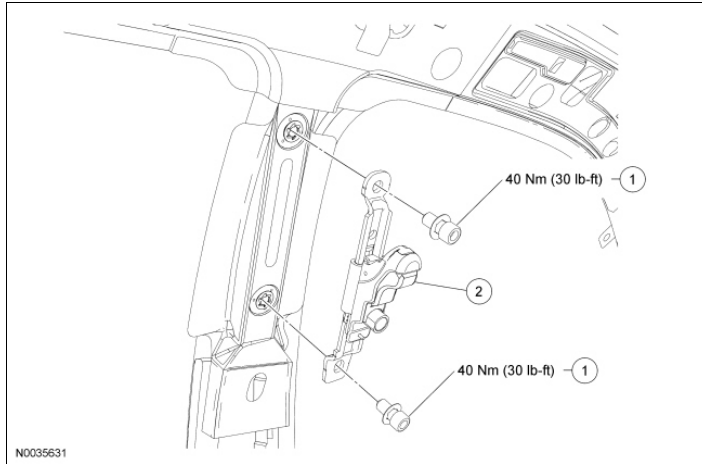

8. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

For police vehicles equipped with fire suppression, repower the fire suppression system.

9. Check the active restraints for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.
-

**Safety Belt Shoulder Height Adjuster****NOTE:** LH shown, RH similar.

Item	Part Number	Description
1	-	Safety belt shoulder height adjuster bolts (part of 602B82) (2 required)
2	602B82	Safety belt shoulder height adjuster

**Removal and Installation**

**⚠ WARNING:** After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- ◆ Retractors
- ◆ Buckles
- ◆ Belt tension sensor (BTS) (if equipped)
- ◆ Front safety belt buckle support assemblies (slide bar) (if equipped)
- ◆ Safety belt shoulder belt height adjusters (if equipped)
- ◆ Child safety seat tether bracket assemblies
- ◆ Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the upper B-pillar trim panel. For additional information, refer to [Section 501-05](#) .

2. Remove the 2 bolts and safety belt shoulder height adjuster.
  - To install, tighten to 40 Nm (30 lb-ft).
3. **NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.

4. Check the active restraints for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.
-

**Torque Specifications**

<b>Description</b>	<b>Nm</b>	<b>lb-in</b>
Front impact severity sensor bolts	12	106
Passenger air bag module bolts (through glove compartment opening)	9	80
Passenger air bag module bolts (under trim panel)	3	27
Restraints Control Module (RCM) bolts	12	106
Seat position sensor bolt	9	80
Seat position sensor magnet assembly bolt	9	80

## SECTION 501-20B: Supplemental Restraint System

2010 Crown Victoria, Grand Marquis  
Workshop Manual

## DESCRIPTION AND OPERATION

Procedure revision date: 08/19/2009

**Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**

The Supplemental Restraint System (SRS) is designed to provide increased collision protection for front seat occupants in addition to that provided by the 3-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantage of the SRS .

The serviceable air bag and safety belt pretensioner SRS components are shown in the following illustrations.

**Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Deployable Components**

Item	Part Number	Description
1	044A74	Passenger air bag module
2	611D10	Passenger seat side air bag module
3	611B08	Passenger safety belt retractor pretensioner
4	14A664	Clockspring
5	043B13	Driver air bag module
6	611D11	Driver seat side air bag module
7	611B09	Driver safety belt retractor pretensioner

# Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Sensor Components

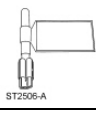

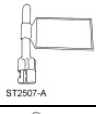

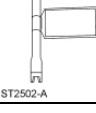

Item	Part Number	Description
1	14B321	Restraints Control Module (RCM)
2	14B418	Passenger Air Bag Deactivation (PAD) indicator
3	14B422	Occupant Classification System (OCS) System
4	14B345	Passenger side impact sensor
5	61202	Passenger seat safety belt buckle with usage detection switch and belt tension sensor
6	14B345	Driver side impact sensor
7	61202	Driver seat safety belt buckle with usage detection switch
8	14B416	Seat position sensor
9	14B006	Front impact severity sensor (2 required)

**Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**

## Special Tool(s)

	Diagnostic Tool, Restraint System (1 required) 418-F088 (105-R0012 or 105-R0013)
	Diagnostic Tool, Restraint System (2 required) 418-133
	Diagnostic Tool, Restraint System (4 required) 418-F395
	Flex Probe Kit 300-NUD105-R025DE or equivalent
	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
	Vehicle Communication Module (VCM) and Integrated Diagnostic system (IDS) software with appropriate hardware, or equivalent scan tool

**Principles of Operation**

Supplemental Restraint System (SRS) consists of a driver and passenger dual stage air bag module (containing an inflator/squib, gas generator and an air bag), safety belt pretensioners (containing an inflator/squib gas generator), impact sensors, a Restraints Control Module (RCM), a clockspring, an air bag warning indicator, Occupant Classification System (OCS) system and a Passenger Air Bag Deactivation (PAD) indicator. These components are all interconnected by a wiring harness and powered by the vehicle's battery. The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the SRS components in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after power and/or ground has been removed from the RCM. If a SRS fault exists, the RCM supplies a ground to flash a coded sequence which is called a Lamp Fault Code (LFC) on the air bag warning indicator located in the Instrument Cluster (IC) module. Each LFC is flashed 3 times after which the air bag indicator will remain lit for the remainder of the key-on cycle. In addition to the self-test at start up, the RCM continuously monitors all of its external and internal circuitry for faults.

In a frontal collision, the impact sensor located in the front of the vehicle detects sudden deceleration and sends an electrical signal to the RCM. The RCM uses the information from the impact sensor in the deployment determination. If the RCM determines that deployment is required, the RCM sends voltage and current to the squib(s) causing the solid chemical propellant to undergo a rapid chemical reaction. This controlled reaction produces harmless nitrogen gas that fills the air bag(s) and/or activates the safety belt pretensioners to remove slack from the safety belt(s).

The RCM communicates through the Data Link Connector (DLC) the current and historical DTCs.

### Air Bag Warning Indicator

The air bag warning indicator:

- is located in the IC module.
- prove out is a function of the RCM . The RCM will prove out the air bag warning indicator by illuminating it for 6 seconds and then turn off.
- will flash/illuminate based on the SRS fault.
- will illuminate continuously if the RCM is disconnected.

### Air Bag Module Second Stage Deployment

Because the driver and passenger front air bags each have 2 deployment stages, it is possible that Stage 1 has deployed and the Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure to make sure that the second stage has been deployed.

- For information on driver air bag module and/or passenger air bag module remote deployment, refer to Pyrotechnic Device Disposal in this section.

### Clockspring

The clockspring:

- is mounted on the steering column, behind the steering wheel.
- allows for continuous electrical connections between the driver air bag module and the RCM when the steering wheel is turned.

### Driver Air Bag Module

The driver air bag module:

- is a dual-stage air bag, deploying at 1 of 2 different rates depending upon impact severity.
- is installed as an assembly.
- is mounted in the center of the steering wheel.

### Impact Sensors

**⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

The SRS employs 5 impact sensors. One of the sensors is integral to the RCM and is not separately serviceable. The RCM is mounted on the center tunnel under the instrument panel. There are 2 front impact

severity sensors located in the front-center of the vehicle, behind the grille. In addition, there are 2 side impact sensors. The side impact sensors are located at the base of each B-pillar below the safety belt retractor and pretensioner. Mounting orientation is critical for correct operation of all impact sensors.

## Loops/Squibs

All deployable devices contain an initiating device called a squib. The squib is part of the deployment loop. Air bag/safety canopy modules can contain more than one squib, some vehicles may have up to 4 squibs in one air bag module. Squibs are often referred to as loops during the diagnostic process.

## Occupant Classification System (OCS) System

**NOTICE:** It is necessary to carry out the Occupant Classification System (OCS) system reset when a front passenger seat cushion is disassembled, a new trim is cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset. Failure to follow these instructions may result in incorrect operation of the OCS system and may cause system failure.

**NOTICE:** Make sure the seat is completely assembled to prevent system failure before carrying out the Occupant Classification System (OCS) system reset.

**NOTE:** To identify between a production OCS system and an OCS service kit, inspect the OCSM electrical connector.

A production OCS system allows the disconnection of the OCSM electrical connector. An OCS system service kit has the OCSM electrical connector glued to the module, it cannot and should not be disconnected or altered. An OCS system service kit also has an in-line connector between the OCSM and the seat wiring harness.

The seat OCS system is found only on the front passenger seat. The front passenger seat OCS system is comprised of a silicone gel-filled bladder mounted in the seat cushion, a pressure sensor that is mounted to the seat frame and an OCSM which is also mounted to the seat frame. Pressure is applied to the OCS system bladder when weight of any occupant or object in the front passenger seat is present. The pressure is then transferred through a tube, is sensed by the OCS system pressure sensor, then electronically communicated to the OCSM . Based on preprogrammed set points, the OCSM will inform the Restraints Control Module (RCM), via a dedicated High Speed Controller Area Network (HS-CAN), of the necessary information. The RCM uses this information in determining if the passenger air bag module is to be deployed in the event of a deployable collision. The RCM may also use this information to illuminate/not illuminate the Passenger Air Bag Deactivation (PAD) indicator. For information regarding PAD indicator operation, refer to Passenger Air Bag Deactivation (PAD) Indicator in this section.

The OCS system components (seat cushion foam pad, bladder with pressure sensor and OCSM ) are calibrated to each other and are serviced as an assembly. **OCS system components are not to be installed separately.**

The OCS system also interprets a variable voltage signal provided by the Belt Tension Sensor (BTS) to identify the presence of a correctly fastened child safety seat in the front passenger seat. The OCSM then communicates with the RCM , automatically deactivating the passenger air bag module. Refer to BTS in this section.

The OCS system is also used for operation of the passenger Belt-Minder®. For information on the passenger Belt-Minder® feature, refer to [Section 501-20A](#) . To deactivate or reactivate the passenger Belt-Minder® feature, refer to [Section 413-01](#) or the Owner's Literature.

### Occupant Classification System Module (OCSM)

Based on programmed limits, the Occupant Classification System Module (OCSM) will inform the Restraints Control Module (RCM), via a dedicated High Speed Controller Area Network (HS-CAN), of the necessary information. The RCM uses this information in determining if the passenger air bag module or passenger seat side air bag module is to be deployed in the event of a deployable collision.

The OCSM monitors the OCS system for faults and communicates on-demand and continuous DTCs to the RCM .

### Passenger Air Bag Deactivation (PAD) Indicator

The Passenger Air Bag Deactivation (PAD) indicator is a visual indicator used to inform the front seat occupants of the passenger air bag deactivation state. The PAD indicator is a stand-alone lamp installed into the vehicle instrument panel in a position visible to each front seat occupant.

The Restraints Control Module (RCM) controls the state of the PAD indicator through a direct hardwire connection, based on information provided by the OCS system. The PAD indicator is lit to indicate the passenger air bag module is disabled. An exemption to this is when the front passenger seat is determined to be empty, and therefore indication of a deactivated passenger air bag module is not necessary. In all other cases, the PAD indicator is unlit when the passenger air bag module is enabled.

The RCM briefly activates the PAD indicator to prove-out the indicator function and verify to the front occupants correct functional operation of the PAD indicator.

The following table indicates the passenger air bag status and the PAD indicator status based the size of the front outboard passenger occupant.

#### Passenger Air Bag Deactivation (PAD) Indicator Status

Occupant Size	Passenger Safety Belt Buckle Status	Passenger Air Bag Status	PAD Indicator Status
None	Unbuckled	Disabled	Unlit
None	Buckled	Disabled	Lit
Small	Buckled/ Unbuckled	Disabled	Lit
Large	Buckled/ Unbuckled	Enabled	Unlit

### Safety Belt Tension Sensor (BTS)

The safety BTS :

- is part of the front outboard passenger safety belt buckle assembly.
- is located on the front passenger seat track safety belt buckle mounting bracket.
- is used in conjunction with the OCS system.
- is a 3-wire Hall-effect sensor that is incorporated into the mounting anchor of the front outboard passenger safety belt buckle assembly.

The BTS is used by the Occupant Classification System (OCS) system to identify the presence of a child safety seat on the front outboard passenger seat, when the child safety seat is installed according to manufacturer instructions. The BTS senses the tension on the safety belt assembly then provides an output to the Occupant Classification System Module (OCSM), indicating that the safety belt assembly is cinched. After sensing the weight applied to the seat by the occupant and using the BTS input, the OCS system determines how the occupant should be classified and communicates this information to the Restraints Control Module (RCM). If the occupant is classified to be a child, the RCM will then automatically deactivate the passenger air bag module and turn the Passenger Air Bag Deactivation (PAD) indicator on. Refer to Passenger Air Bag Deactivation (PAD) Indicator in this section for the indicator status and operation.

### Passenger Air Bag Module

The passenger air bag module:

- is a dual-stage air bag, deploying at 1 of 2 different rates depending upon impact severity.
- is installed as an assembly.
- is mounted in the passenger side of the instrument panel.

### Restraints Control Module (RCM)

**⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

**⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

#### **The RCM carries out the following functions:**

- Signals the inflators to deploy the air bags in the event of a deployable crash.
- Activates the safety belt retractor pretensioners to remove slack from the safety belt.
- Monitors the air bag Supplemental Restraint System (SRS) for faults.
- Illuminates the air bag warning indicator if a fault is detected.
- Receives information from the front and side impact sensors.
- Sends safety belt buckle status to the Instrument Cluster (IC) module for safety belt indicator and Belt-Minder®.
- Flashes the air bag warning indicator to indicate the Lamp Fault Code (LFC) detected.
- Communicates with the Occupant Classification System Module (OCSM) on a dedicated High Speed Controller Area Network (HS-CAN).
- Signals the Lighting Control Module (LCM) module to activate a chime if a fault is detected.
- Communicates through the Data Link Connector (DLC) the current or historical DTCs.
- Contains an internal sensor which is not serviced separately.

The RCM monitors the SRS for possible faults. If a fault is detected, the RCM will illuminate the air bag warning indicator located in the IC and signal the LCM to activate the chime.

The chime is a series of 5 sets of 5-tone bursts. If the chime is heard and/or the air bag warning indicator is illuminated, the SRS and the air bag warning indicator require repair. When the ignition is cycled (turned off and then on), the air bag warning indicator will remain lit for 6 seconds and then go out. If a SRS fault exists, the air bag warning indicator will then flash the 2-digit LFC. The air bag warning indicator will flash the LFC

5 times, then it will remain illuminated for the rest of the ignition cycle. The RCM will also communicate the current and historical DTCs through the DLC , using the scan tool.

LFCs are prioritized. If 2 or more faults occur at the same time, the fault having the highest priority will be displayed first. After that fault has been corrected, the next highest priority fault will be displayed.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the SRS components in the event that the ignition circuit is damaged in a collision before air bag deployment is activated. The backup power supply will deplete its stored energy approximately one minute after power and/or ground has been removed from the RCM .

### **Safety Belt Buckle Switches**

The safety belt buckle switches are comprised of integrated circuits called Hall-effect sensors. The safety belt buckle switches (Hall-effect sensors) are located in the driver and passenger safety belt buckles. Safety belt buckle switches are used to indicate to the RCM whether the safety belts are buckled or unbuckled. The RCM uses this information in determining the deployment of the dual-stage driver and passenger air bag modules.

### **Safety Belt Retractor Pretensioners**

Safety belt retractor pretensioners are pyrotechnic devices integrated to the driver and passenger safety belt retractor assemblies. The safety belt retractor pretensioners work in conjunction with the safety belt buckle pretensioners and control the tension of the driver and passenger safety belts in the event of a deployable collision. The RCM monitors the readiness of the safety belt retractor pretensioners. The RCM uses this information and all other information provided by the restraints system to determine what action is to be taken.

### **Seat Track Position Sensor**

The seat track position sensor is a Hall-effect sensor located on the driver seat track. Based on programmed limits, the seat track position sensor will inform the Restraints Control Module (RCM) of the driver seat position. The RCM uses this information in determining the deployment of the dual-stage driver air bag module.

### **Secondary Air Bag Warning (Chime)**

The secondary air bag warning chime, is an audible chime generated by the Lighting Control Module (LCM). If the Restraints Control Module (RCM) has detected a fault with the air bag warning indicator, a DTC will be stored in the memory of the RCM . Upon the RCM sensing that a Supplemental Restraint System (SRS) fault has been detected, the RCM will signal the LCM to sound the secondary air bag warning chime in a pattern of 5 sets of 5 beeps.

### **Seat Side Air Bag Module**

The driver/passenger seat side air bag module:

- will deploy upon receiving a signal from the Restraints Control Module (RCM) initiated by the driver/passenger side impact sensor.
- is installed as an assembly.

- is mounted in the seat back.

## **Diagnostic Instructions**

The symptom chart can be used to help locate Supplemental Restraint System (SRS) concerns if no DTCs are retrieved and the listed symptoms are observed. Whether or not the listed symptoms are observed, always carry out the following:

1. Retrieve all DTCs stored in the Restraints Control Module (RCM) memory. Refer to Retrieve/Clear Continuous DTCs in this section.
2. Run the On-Demand Self Test to determine what DTCs are currently being sensed by the RCM .
3. If on-demand DTCs are different than continuous memory DTCs, always repair the on-demand DTCs first.

A DTC can indicate several concerns. The DTCs are to assist in system diagnosis and are not to be considered definitive. Always refer to the pinpoint test corresponding to the DTC to determine where the concern lies and to repair the concern correctly.

## **Self Test/Continuous Memory and Clear DTCs**

During vehicle operation, the Restraints Control Module (RCM) will detect and store both intermittent and hard failure DTCs in non-volatile memory. The DTC strategy employed by the RCM incorporates a time-out scheme for determining when a concern exists in the system. This requires a concern to exist for up to one minute in the system before the RCM will detect it.

Once 128 key cycles have been recorded since the concern was last detected, the DTC will automatically be removed from memory.

## **Lamp Fault Code (LFC)**

When the Restraints Control Module (RCM) detects a system fault, it will flash a coded sequence which is called a Lamp Fault Code (LFC) on the air bag warning indicator located in the Instrument Cluster (IC) module. The code is 2 digits. The first digit is flashed with a 0.5-second interval between pulses. There is a 2-second pause before the second digit is flashed, which also has a 0.5-second interval between pulses. There is a 5-second pause between each display of an LFC .

Each LFC is flashed 3 times after which the air bag indicator will remain lit for the remainder of the key-on cycle (except for DTC B2792 [cross link between firing loops] which only flashes one LFC ). If there are multiple LFCs , each LFC will flash in order of priority.

## **Fault PIDs**

There are 2 types of fault PIDs that can be reported by the Restraints Control Module (RCM). The first type, considered conventional, has only one level of fault reporting and identifies a specific concern for a given component and points to a particular diagnostic path, example: DTC B1317 (Battery Voltage High).

The second type uses a process within the software of the controller that maps the byte and bit to name a specific device and fault condition. This process is called Bit-mapping and referred to as fault PIDs in the

diagnosis of the vehicle. This type does not identify the specific concern or component on the first level of fault reporting, example: DTC B2293 (Restraint system - Airbag Fault). DTC B2293 can have up to 28 specific on-demand fault PIDs (areas of concern) associated with this DTC.

Those associated fault PIDs are an extension of the information provided by the DTC and are identified by the same DTC number. A scan tool must be used to view DTCs and their fault PIDs. Once a scan tool has retrieved a DTC, use the scan tool to view the fault PIDs. In the diagnostic path, other types of PIDs are sometimes used to determine the root cause (example: resistance or voltage PIDs).

When viewing of fault PIDs has been carried out, the scan tool can display the PIDs associated with that DTC, including the status or state that exists (on-demand [active] DTC) or existed (continuous memory [historic]) DTC. Refer to the manufacturer instructions for the scan tool being used on how to view fault PIDs.

### **Prove Out Procedure**

Turn the ignition from the OFF to the ON position and monitor the air bag warning indicator with all Supplemental Restraint System (SRS) components connected or restraint system diagnostic tools installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will:

- fail to light.
- remain lit continuously.
- flash.

The flashing might not occur until approximately 30 seconds after the ignition has been turned from the OFF to the ON position. This is the time required for the Restraints Control Module (RCM) to complete the testing of the SRS . If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.

### **Glossary**

#### **Air Bag/Pretensioner Restraint System Diagnostic Tools**

Air bag/pretensioner restraint system diagnostic tools are used to simulate the equivalent resistance of an air bag module or safety belt pretensioner during certain diagnostic procedures.

#### **Deactivate the Supplemental Restraint System (SRS)**

Deactivate the Supplemental Restraint System (SRS) means to carry out a deactivation procedure. Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

#### **Depower the SRS**

Depower the LFC means to disconnect the battery and remove the RCM fuse. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

#### **Reactivate the SRS**

Reactivate the SRS means to carry out the reactivation procedure. Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

## Repower the SRS

Repower the SRS means to remove any restraint system diagnostic tools that may have been installed, turn the ignition ON, install the RCM fuse and connect the battery ground cable. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

## Inspection and Verification

**⚠ WARNING: If equipped with fire suppression system, refer to Section 100-02B for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.**

1. Verify the customer concern by checking the air bag warning indicator in the Instrument Cluster (IC) module. Refer to Prove Out the Supplemental Restraint System (SRS) in this section.
2. Visually inspect for obvious signs of mechanical or electrical damage. Do not disconnect electrical connectors until directed to do so within the pinpoint test.

## Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> <li>• Damaged Restraints Control Module (RCM) or loose mounting</li> <li>• Damaged front impact severity sensor(s) or loose mounting</li> <li>• Damaged side impact sensor(s) or loose mounting</li> <li>• Damaged or disconnected Passenger Air Bag Deactivation (PAD) indicator</li> <li>• Damaged or loose mounting of a Occupant Classification System (OCS) system component</li> </ul>	<ul style="list-style-type: none"> <li>• Open Central Junction Box (CJB) fuse 22 (10A)</li> <li>• Damaged wiring harness</li> <li>• Loose, damaged or corroded connectors</li> <li>• Circuitry open/shorted</li> <li>• Damaged shorting bars</li> <li>• Loose, damaged or pinched passenger seat wire harness</li> </ul>

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .

- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.
6. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 to diagnose no response from the PCM.
  7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record on-demand and Continuous Memory Diagnostic Trouble Codes (CMDTCs) from the RCM .
  8. If the DTCs retrieved are related to the concern, GO to the DTC Charts. For all other DTCs, refer to Section 419-10 .
  9. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

## DTC Charts

The DTCs can be retrieved from the Restraints Control Module (RCM) with a scan tool via the DLC .

### Supplemental Restraint System (SRS) DTC Chart

DTC	Description	Action To Take
-	The Air Bag Warning Indicator is Illuminated Continuously	<u>GO to Pinpoint Test A</u> .
B1231	Crash Data Memory Full	INSTALL a new RCM and impact sensors. REFER to <u>Inspection and Repair After a Supplemental Restraint System (SRS) Deployment</u> in this section.

<sup>a</sup> LFC: Flashed on air bag warning indicator.

## Symptom Chart

Symptom Chart

## Pinpoint Tests

### Pinpoint Test A: The Air Bag Warning Indicator is Illuminated Continuously

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Normal Operation

During normal operation, the Restraints Control Module (RCM) will illuminate the air bag warning indicator continuously for approximately 6 seconds and then go out after the ignition is placed in the ON or START position and no Supplemental Restraint System (SRS) faults exist. The air bag warning indicator will remain illuminated continuously after 3 cycles of a Lamp Fault Code (LFC), if a fault exists. Be sure to cycle the ignition and look for an approximate 6-second indicator prove-out without LFCs .

The RCM will communicate DTCs to the scan tool through the Data Link Connector (DLC). If the scan tool displays NO COMMUNICATION when retrieving DTCs, refer to [Section 418-00](#) to diagnose the no communication concern.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Instrument Cluster (IC) module
- RCM disconnected
- RCM

**PINPOINT TEST A: THE AIR BAG WARNING INDICATOR IS ILLUMINATED CONTINUOUSLY**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

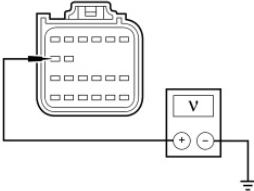

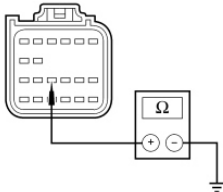

**NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

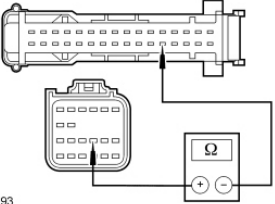

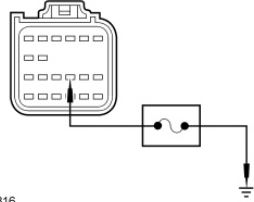

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>A1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Were any DTCs retrieved during self-test?</b></li> </ul>	<p><b>Yes</b> If CMDTCs were retrieved, GO to <a href="#">A2</a> . If on-demand DTCs were retrieved, GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> GO to <a href="#">A2</a> .</p>
<b>A2 CHECK THE RCM CONNECTION</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> </ul>	<p><b>Yes</b> GO to <a href="#">A3</a> .</p>

<ul style="list-style-type: none"> <li>• Depower the SRS . Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Inspect RCM C310a to be fully seated and locked. Seat and lock connector(s) as necessary.</li> <li>• <b>Is RCM C310a fully connected and the connector locking tab engaged?</b></li> </ul>	<p><b>No</b> CONNECT C310a and ENGAGE the locking tab. GO to <u>A7</u> .</p>
<p><b>A3 CHECK CIRCUIT 937 (RD/WH) FOR VOLTAGE</b></p>	
<ul style="list-style-type: none"> <li>• Deactivate the SRS . Refer to <u>Supplemental Restraint System (SRS) Deactivation and Reactivation</u> in this section.</li> <li>• Disconnect: RCM C310a and C310b.</li> <li>• Ignition ON.</li> <li>• Measure the voltage between RCM C310a-12, circuit 937 (RD/WH), harness side and ground.</li> </ul>  <p>A0039638</p> <ul style="list-style-type: none"> <li>• <b>Is voltage greater than 10 volts?</b></li> </ul>	<p><b>Yes</b> GO to <u>A4</u> .</p> <p><b>No</b> VERIFY that Central Junction Box (CJB) fuse 22 (10A) is OK. If OK, REPAIR circuit 937 (RD/WH). GO to <u>A7</u> . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.</p>
<p><b>A4 CHECK FOR AN OPEN GROUND CIRCUIT</b></p>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Measure the resistance between RCM C310a-16, circuit 676 (PK/OG), harness side and ground.</li> </ul>  <p>A0039639</p> <ul style="list-style-type: none"> <li>• <b>Is the resistance less than 5 ohms?</b></li> </ul>	<p><b>Yes</b> GO to <u>A5</u> .</p> <p><b>No</b> REPAIR circuit 676 (PK/OG). GO to <u>A7</u> .</p>
<p><b>A5 CHECK CIRCUIT 608 (BK/YE) FOR AN OPEN</b></p>	
<ul style="list-style-type: none"> <li>• Disconnect: IC Module C2220.</li> <li>• Measure the resistance between IC module C2220-12, circuit 608 (BK/YE), harness side and RCM C310a-15, circuit 608 (BK/YE), harness side.</li> </ul>	<p><b>Yes</b> GO to <u>A6</u> .</p> <p><b>No</b> REPAIR circuit 608 (BK/YE). GO to <u>A7</u> .</p>

 <p>N0032293</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 0.5 ohm?</li> </ul>	
<b>A6 CHECK THE AIR BAG WARNING INDICATOR OPERATION (DRIVE INDICATOR OFF)</b>	
<ul style="list-style-type: none"> <li>• Connect: IC Module C2220.</li> <li>• Ignition ON.</li> <li>• Connect a fused jumper wire between RCM C310a-15, circuit 608 (BK/YE), harness side and ground.</li> </ul>  <p>N0074816</p> <ul style="list-style-type: none"> <li>• Is the air bag warning indicator off?</li> </ul>	<p><b>Yes</b> INSTALL a new RCM . REFER to <u>Restraints Control Module (RCM)</u> in this section. GO to <u>A7</u> .</p> <p><b>No</b> INSTALL a new IC module. REFER to <u>Section 413-01</u> . GO to <u>A7</u> .</p>
<b>A7 CHECK FOR ADDITIONAL SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.</b></li> <li>• Reconnect all SRS components (if previously disconnected). <ul style="list-style-type: none"> <li>◆ If previously directed to depower the SRS , repower the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>◆ If previously directed to deactivate the SRS , reactivate the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Deactivation and Reactivation</u> in this section.</li> </ul> </li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• Are any DTCs retrieved on-demand during self-test?</li> </ul>	<p><b>Yes</b> Do not clear any DTCs until all DTCs have been resolved. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

**Pinpoint Test B: DTC B1869**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Normal Operation**

During normal operation, the Restraints Control Module (RCM) will illuminate the air bag warning indicator continuously for approximately 6 seconds and then go out after the ignition is placed in the ON or START position and no air bag faults exist. The air bag warning indicator will remain illuminated continuously after 3 cycles of a Lamp Fault Code (LFC), if a fault exists. Be sure to cycle the ignition and look for an approximate 6-second indicator prove-out without LFCs .

If the RCM detects an open or short to ground on the air bag warning indicator circuit, it will store DTC B1869 in memory and sound the secondary air bag warning.

- DTC B1869 (Lamp Air Bag Warning Indicator Circuit Open or Short to Ground) - If the RCM detects an open circuit or short to ground when the indicator is not active, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- RCM
- Air bag warning indicator
- Instrument Cluster (IC) module

**PINPOINT TEST B: DTC B1869**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

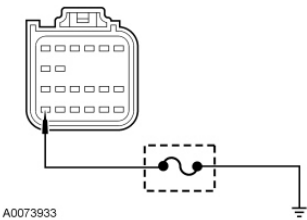

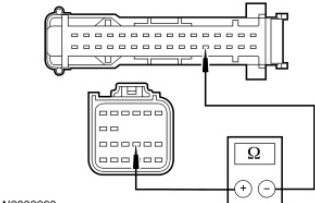

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

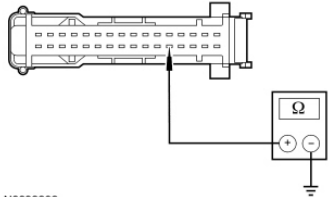

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>B1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> </ul>	<p><b>Yes</b> If the air bag warning indicator lamp <b>does</b> illuminate, GO to <u>B2</u> .</p>

<ul style="list-style-type: none"> <li>• Was DTC B1869 retrieved on-demand during self-test?</li> </ul>	<p>If the air bag warning indicator <b>does not</b> illuminate, GO to <u>B4</u> .</p> <p><b>No</b> This is an intermittent fault when present as a CMDTC only. GO to <u>B6</u> .</p>
<p><b>B2 CHECK THE AIR BAG WARNING INDICATOR OPERATION (DRIVE INDICATOR OFF)</b></p>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Deactivate the SRS . Refer to <u>Supplemental Restraint System (SRS) Deactivation and Reactivation</u> in this section.</li> <li>• Disconnect: RCM C310a and C310b.</li> <li>• Ignition ON.</li> <li>• Connect a fused jumper wire between RCM C310a-24, circuit 1632 (TN/LB), harness side and ground.</li> </ul>  <p>A0073933</p> <ul style="list-style-type: none"> <li>• Is the air bag warning indicator off?</li> </ul>	<p><b>Yes</b> INSTALL a new RCM . REFER to <u>Restraints Control Module (RCM)</u> in this section. GO to <u>B7</u> .</p> <p><b>No</b> GO to <u>B3</u> .</p>
<p><b>B3 CHECK CIRCUIT 608 (BK/YE) FOR AN OPEN</b></p>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Disconnect: IC Module C2220.</li> <li>• Measure the resistance between IC module C2220-12, circuit 608 (BK/YE), harness side and RCM C310a-15, circuit 608 (BK/YE), harness side.</li> </ul>  <p>N0032293</p> <ul style="list-style-type: none"> <li>• Is the resistance less than 0.5 ohm?</li> </ul>	<p><b>Yes</b> INSTALL a new IC module. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>
--	---

### Pinpoint Test C: DTC B1870

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Normal Operation

During normal operation, the Restraints Control Module (RCM) will illuminate the air bag warning indicator continuously for approximately 6 seconds and then go out after the ignition is placed in the ON or START position and no air bag faults exist. The air bag warning indicator will remain illuminated continuously after 3 cycles of a Lamp Fault Code (LFC), if a fault exists.

If the RCM detects a short to battery on the air bag warning indicator circuit, it will store DTC B1870 in memory and sound the secondary air bag warning.

- DTC B1870 (Air Bag Warning Indicator Circuit Short to Battery) - If the RCM detects a short to battery on the air bag warning indicator circuit, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Instrument Cluster (IC) module
- RCM

**PINPOINT TEST C: DTC B1870**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

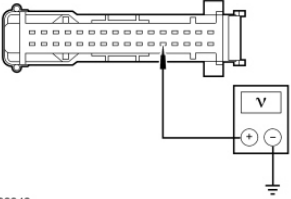

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>C1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC B1870 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until is corrected and the DTC is no longer retrieved on-demand during self test. PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>
---	---

#### Pinpoint Test D: DTC B1884

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B1884:

- LFC 1-8 - PAD Warning Lamp Circuit Failure

#### Normal Operation

The RCM briefly activates the PAD indicator to verify to the occupants correct functional operation of the PAD indicator.

If the RCM detects an open or short to ground on the PAD indicator circuit, it will store DTC B1884 in memory, flash LFC 1-8 on the air bag warning indicator.

- DTC B1884 ( PAD Warning Lamp Circuit Failure) - If the RCM detects an open or short to ground when the indicator is not active, it will set this DTC.

#### **This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- PAD indicator
- RCM

#### PINPOINT TEST D: DTC B1884

**⚠ WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate**

vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

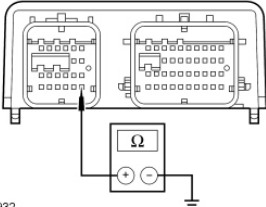

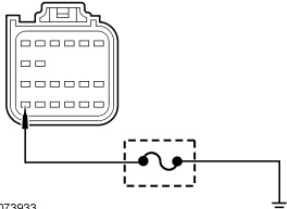

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

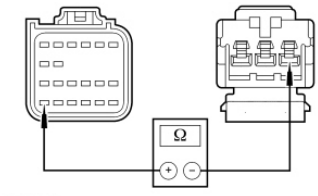

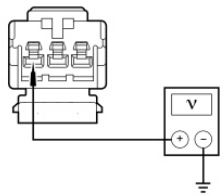

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>D1 RETRIEVE SRS DTCs</b>

RETURN the vehicle to the customer.</p>

**Pinpoint Test E: DTC B1890**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B1890:

- LFC 10-14 - PAD Warning Lamp Circuit Short to Battery

**Normal Operation**

The RCM briefly activates the PAD indicator to verify to the occupants correct functional operation of the PAD indicator.

If the RCM detects a short to battery on the PAD indicator circuit, it will store DTC B1890 in memory, flash LFC 10-14 on the air bag warning indicator.

- DTC B1890 (PAD Warning Lamp Circuit Short to Battery) - If the RCM detects a short to battery on the PAD indicator circuit when the indicator is activated, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- PAD indicator
- RCM

**PINPOINT TEST E: DTC B1890**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

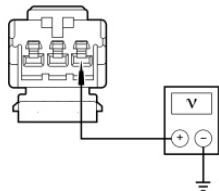

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>E1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Was DTC B1890 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. RETURN the vehicle to the customer.</p>

**Pinpoint Test F: DTC B1891**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B1891:

- LFC 10-15 - Air Bag Tone Warning Indicator Circuit Short to Battery

**Normal Operation**

The Restraints Control Module (RCM) monitors its connection to the Lighting Control Module (LCM) at C310a pin 23. This connection is used to signal a chime if the air bag warning indicator is inoperative and another Supplemental Restraint System (SRS) fault exists.

If the RCM detects a short to battery on the connection to the LCM , it will store DTC B1891 in memory and flash LFC 10-15 on the air bag warning indicator.

- DTC B1891 (Air Bag Tone Warning Indicator Circuit Short to Battery) - If the RCM detects a short to battery on the air bag tone warning indicator circuit, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- LCM
- RCM

**PINPOINT TEST F: DTC B1891**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

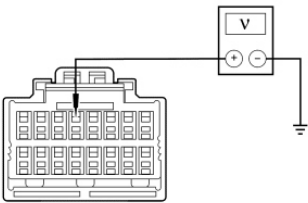

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

### Pinpoint Test G: DTC B1892

Refer to Wiring Diagrams Cell **46** , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B1892:

- LFC 5-3 - Air Bag Tone Warning Indicator Circuit Open or Short to Ground

#### Normal Operation

The connection between the Lighting Control Module (LCM) and the Restraints Control Module (RCM) is used to signal a chime if the primary air bag warning indicator is inoperative and another Supplemental Restraint System (SRS) fault exists. The RCM monitors its connection to the LCM at C310a Pin 23.

If the RCM detects an open or short to ground on the circuit to the LCM , it will store DTC B1892 in memory, flash LFC 5-3 on the air bag warning indicator.

- DTC B1892 (Air Bag Tone Warning Indicator Circuit Open or Short to Ground) - If the RCM detects an open circuit or short to ground when the indicator is not active, it will set this DTC.

#### **This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- LCM
- RCM

**PINPOINT TEST G: DTC B1892**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

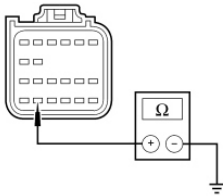

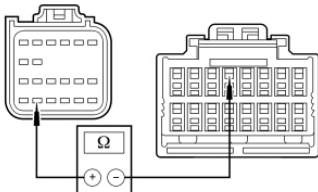

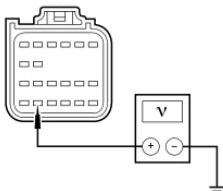

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>G1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC B1892 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. ---	--

**Pinpoint Test H: B1921**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B1921:

- LFC 1-4 - Air Bag Diagnostic Monitor Ground Circuit Open

**⚠ WARNING:** Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

**NOTE:** A resistance difference as low as 10 ohms may set the LFC .

**Normal Operation**

The Restraints Control Module (RCM) monitors the resistance between the ground connections at the mounting bracket and the reference ground at the C310a Pin 16, circuit 676 (PK/OG).

If the RCM detects a difference in resistance, it will store DTC B1921 in memory, flash LFC 1-4 on the air bag warning indicator.

- DTC B1921 (Air Bag Diagnostic Monitor Ground Circuit Open) - If the RCM detects a difference in resistance between the ground circuit and the RCM mounting ground, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- RCM bracket not securely mounted
- Wiring, terminals or connectors
- RCM

**PINPOINT TEST H: DTC B1921**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

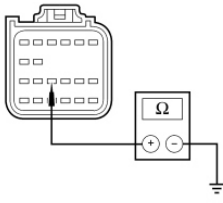

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>H1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC B1921 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

**Pinpoint Test I: DTC B2290**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Codes (LFCs) indicate the specific fault PIDs associated with DTC B2290:

<b>LFC</b>	<b>Description</b>
1-6	OCS Communication Fault
11-8	OCS Module Fault
11-9	OCS Calibration Fault
11-10	OCS Sensing Element Fault
11-11	OCS Mounting Fault

**Normal Operation**

The Occupant Classification System (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. The OCS system components (seat cushion foam pad, bladder with pressure sensor and Occupant Classification System Module (OCSM)) are calibrated to each other and are serviced as an assembly. The OCS system components are not to be installed separately. If a new OCS system, OCS system component or seat cushion foam pad are needed, a new OCS system service kit (seat cushion foam pad, bladder with pressure sensor and OCSM ) must be installed as an assembly.

The Restraints Control Module (RCM) communicates with the OCS system for faults. If the RCM detects one of the following faults on any of the OCS system circuits, it will store DTC B2290 in memory and, depending on the fault, flash a LFC on the air bag warning indicator.

<b>Fault PIDs <sup>a</sup></b>	<b>Description</b>	<b>Fault Trigger Condition</b>
2290_24_OD and 2290_24_CM	OCS Sensing Element Fault, Front Pass. Side	When the Occupant Classification System Module (OCSM) senses a fault with the bladder pressure sensor circuits, a fault will be indicated.
2290_25_OD and 2290_25_CM	OCS Calibration Fault, Front Pass. Side	When the OCSM senses a difference in calibration values, a fault will be indicated.
2290_26_OD and 2290_26_CM	OCS Communications Fault, Front Pass. Side	When the OCSM is not able to communicate with the Restraints Control Module (RCM), a fault will be indicated.
2290_27_OD and 2290_27_CM	Generic OCS Module Fault, Front Pass. Side	When the OCSM senses a fault with the bladder pressure sensor and/or circuits, a fault will be indicated.
2290_28_OD and 2290_28_CM	Occupant Classification Sensor Mounting Fault, Front Passenger Side	When the OCSM senses a fault with one of its components, a fault will be indicated.

<sup>a</sup> Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2290. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2290.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors

- OCS system component
- Pressure sensing fault
- Module mounting condition

**PINPOINT TEST I: DTC B2290**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

**NOTE:** To identify between a production OCS system and a OCS system service kit, inspect the OCSM electrical connector. A production OCS system allows the disconnection of the electrical connector from the OCSM . A OCS system service kit has the OCSM electrical connector glued to the module, it cannot and should not be disconnected or altered.

Test Step	Result / Action to Take
<b>I1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All B2290 Fault PIDs. <ul style="list-style-type: none"> <li>◆ Refer to PID list in Normal Operation to view 2290 fault PIDs.</li> </ul> </li> <li>• <b>Do any 2290 fault PIDs indicate a fault?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test.</p> <p>Using the fault PIDs recorded, GO to the appropriate pinpoint test step.</p> <p><b>Vehicles with a production OCS system</b></p>

For 2290\_26\_OD ( OCS Communications Fault, Front Pass. side) ( LFC 1-6), GO to I2 .

For 2290\_28\_OD (Occupant Classification Sensor Mounting Fault, Front Passenger Side) ( LFC 11-11), GO to I19 .

For 2290\_27\_OD (Generic OCS Module Fault, Front Pass. side) ( LFC 11-8), INSTALL a new OCS system service kit. REFER to Occupant Classification Sensor in this section. GO to I21 .

For 2290\_25\_OD ( OCS Calibration Fault, Front Pass. side) ( LFC 11-9), GO to I20 .

For 2290\_24\_OD ( OCS Sensing Element Fault, Front Pass. side) (11-10), GO to I11 .

#### **Vehicles with a OCS service kit**

For 2290\_26\_OD ( OCS Communications Fault, Front Pass. side) ( LFC 1-6), GO to I2 .

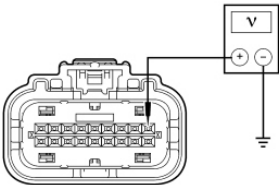

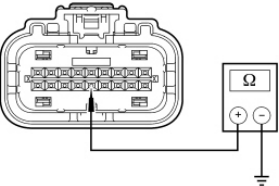

For 2290\_27\_OD (Generic OCS Module Fault, Front Pass. side) ( LFC 11-8), INSTALL a new OCS system service kit. REFER to Occupant Classification Sensor in this section. GO to I21 .

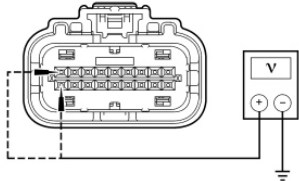

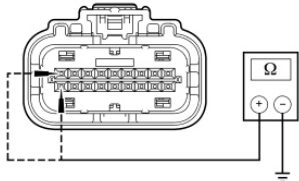

For 2290\_25\_OD ( OCS Calibration Fault, Front Pass. side) ( LFC 11-9), GO to I20 .

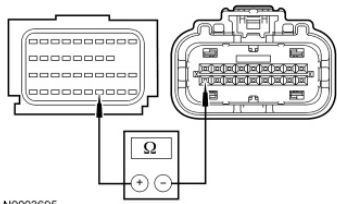

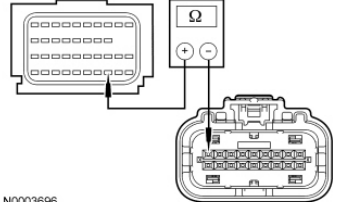

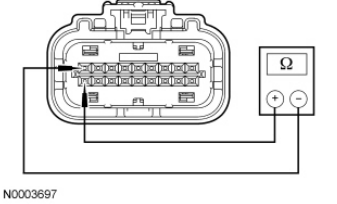

For 2290\_24\_OD ( OCS Sensing Element Fault, Front Pass. side) ( LFC 11-10), INSTALL a new OCS system service kit. REFER to Occupant Classification Sensor in this section. GO to I21 .

#### **No**

This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to I21 .

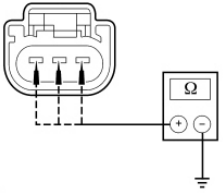

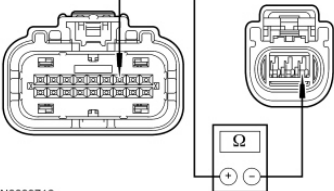

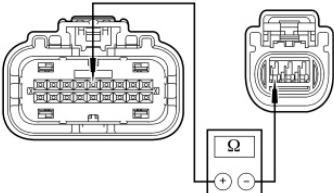

<b>I2 CHECK THE SEAT WIRING AND CONNECTORS</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the SRS . Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Disconnect: RCM C310a and C310b.</li> <li>• Carry out a thorough visual inspection of the OCS system wiring, terminals and connectors, the RCM wiring, terminals and connectors at C310b-33 and 34, and the related seat wiring harness and body wiring harness terminals and connectors.</li> <li>• <b>Were any problems noted?</b></li> </ul>	<p><b>Yes</b> REPAIR the seat connectors and wiring as needed. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Ignition ON.</li> <li>• ⚠ <b>WARNING:</b> Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly</li> </ul>	<p><b>Yes</b> INSTALL a new RCM . REFER to <u>Restraints Control Module (RCM)</u> in this section. GO to <u>I22</u> .</p> <p><b>No</b> Fault corrected. GO to <u>I22</u> .</p>

assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increases the risk of serious personal injury or death in a crash.

- **NOTICE:** To prevent system failure, it is necessary to carry out the OCS system reset when a front passenger seat cushion is disassembled, a new trim cover installed or an OCS system service kit is installed. A scan tool is used to carry out the OCS system reset.
- **NOTICE:** To prevent system failure, the following precautions must be taken before carrying out the OCS system reset:
  - ◆ Make sure the voltage to the OCSM is above 8.0 volts and less than 18.0 volts.
  - ◆ Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.
  - ◆ Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.
  - ◆ Make sure a minimum 8-second time period has passed after cycling the ignition ON before the carrying out the OCS system reset process.

**Carry out the OCS system reset.**

- If the first system reset attempt was unsuccessful, carry out a thorough inspection of the following and repair any concerns found.
  - ◆ OCS system connector and wiring for damage
  - ◆ Pressure sensor hose for kinks and/or damage
  - ◆ Seat-related wiring harness and body wiring harness terminals and connectors for damage
- Carry out a second OCS system reset. If the second attempt is unsuccessful, install a new OCS system service kit. For additional information, refer to OCS in this section
- Ignition OFF.
- **NOTE:** The ignition must be cycled after the OCS system reset.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test - RCM .
- Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2290 Fault PIDs.
  - ◆ Refer to PID list in Normal Operation to view 2290 fault PIDs.
- **Do any 2290 fault PIDs indicate a fault?**

I19 CHECK FOR AN OCSM MOUNTING FAULT	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the SRS . Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• <b>NOTE:</b> The OCSM must be correctly positioned and securely fastened in place. Failure to do so can set a DTC in the RCM .</li> <li>• Inspect the OCSM for correct mounting location and direction, that the OCSM fasteners are tight, no damage to the OCSM and no damage to the seat cushion frame.</li> <li>• Inspect the OCSM for correct mounting location and direction, that the OCSM fasteners are tight, no damage to the OCSM and no damage to the seat cushion frame.</li> <li>• <b>Is the OCSM correctly located and are the fasteners tight and is there no damage to components?</b></li> </ul>	<p><b>Yes</b> INSTALL a new OCS system service kit. REFER to <u>Occupant Classification Sensor</u> in this section. GO to <u>I21</u> .</p> <p><b>No</b> REPAIR as necessary. REFER to <u>Occupant Classification Sensor</u> in this section for correct mounting location/direction of the OCSM and the correct fasteners for mounting of the OCSM . If the seat cushion frame is damaged, REFER to the appropriate procedure in <u>Section 501-10</u> for repair. GO to <u>I22</u> .</p>
I20 CHECK OCS SYSTEM - CALIBRATION FAULT	
<p><b>NOTE:</b> When a calibration fault is present, <b>carry out</b> the OCS system reset before installing a service kit.</p> <p><b>NOTE:</b> Make sure all restraint system diagnostic tools, sensor electrical connectors, OCS system components and the RCM electrical connector are connected before carrying out the self test. If not, DTCs will be recorded.</p> <ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• <b>⚠ WARNING:</b> Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increases the risk of serious personal injury or death in a crash.</li> <li>• <b>NOTICE:</b> To prevent system failure, the following precautions must be taken before carrying out the Occupant Classification System (OCS) system reset: <ul style="list-style-type: none"> <li>♦ Make sure the voltage to the Occupant Classification System Module (OCSM) is above 8.0 volts and less than 18.0 volts.</li> <li>♦ Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. REFER to <u>Occupant Classification Sensor</u> in this section. GO to <u>I21</u> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. <b>Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.</b> REPAIR any intermittent wiring, terminal or connector concerns found. GO to <u>I22</u> .</p>
<b>I22 CHECK FOR ADDITIONAL SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>•  <b>WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.</b></li> </ul>	<p><b>Yes</b> Do not clear any DTCs until all DTCs have been resolved. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p>

<ul style="list-style-type: none"> <li>• Reconnect all SRS components (if previously disconnected).</li> <li>• If previously directed to depower the SRS , repower the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Are any DTCs retrieved on-demand during self-test?</b></li> </ul>	<b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.
--	---

### Pinpoint Test J: DTC B2292

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Codes (LFCs) indicate the specific fault PIDs associated with DTC B2292:

LFC	Description	LFC	Description
3-3	Driver Pretensioner Open/High Resistance Fault	9-7	Driver Pretensioner Short to Battery Fault
3-4	Passenger Pretensioner Open/High Resistance Fault	9-8	Passenger Pretensioner Short to Battery Fault
9-3	Driver Pretensioner Short to Ground Fault	9-11	Driver Pretensioner Low Resistance Fault
9-4	Passenger Pretensioner Short to Ground Fault	9-12	Passenger Pretensioner Low Resistance Fault

#### Normal Operation

The safety belt retractor pretensioners are activated by the Restraints Control Module (RCM) to remove excessive slack from the safety belt webbing when an impact exceeding preprogrammed limits is detected.

The RCM checks all of the safety belt retractor pretensioners for faults. If the RCM detects one of the following faults on any of the safety belt retractor pretensioner circuits, it will store DTC B2292 in memory and, depending on the fault, flash a LFC on the air bag warning indicator.

Fault PIDs <sup>a</sup>	Description	Fault Trigger Condition
2292_24_OD and 2292_24_CM	Pretensioner Circuit Short to Ground, Front Passenger Side	When the Restraints Control Module (RCM) senses a short to ground on either passenger safety belt retractor pretensioner circuit, a fault will be indicated.
2292_25_OD and 2292_25_CM	Pretensioner Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on either passenger safety belt retractor pretensioner circuit, a fault will be indicated.
2292_26_OD and 2292_26_CM	Pretensioner Circuit Open, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger safety belt retractor pretensioner

		circuits, a fault will be indicated.
2292_27_OD and 2292_27_CM	Pretensioner Circuit Resistance Low, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger safety belt retractor pretensioner circuits, a fault will be indicated.
2292_28_OD and 2292_28_CM	Pretensioner Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on either driver safety belt retractor pretensioner circuit, a fault will be indicated.
2292_29_OD and 2292_29_CM	Pretensioner Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on either driver safety belt retractor pretensioner circuit, a fault will be indicated.
2292_30_OD and 2292_30_CM	Pretensioner Circuit Open, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver safety belt retractor pretensioner circuits, a fault will be indicated.
2292_31_OD and 2292_31_CM	Pretensioner Circuit Resistance Low, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver safety belt retractor pretensioner circuits, a fault will be indicated.

<sup>a</sup> Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2292. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2292.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Pretensioner
- RCM

**PINPOINT TEST J: DTC B2292**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

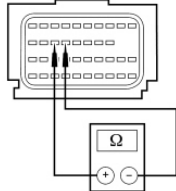

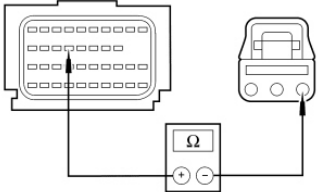

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

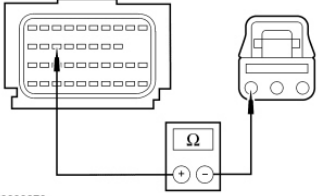

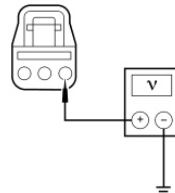

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

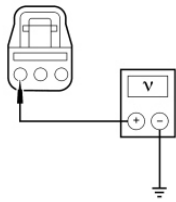

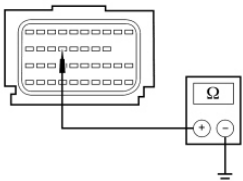

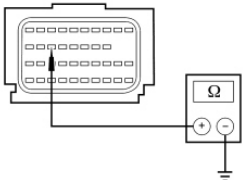

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

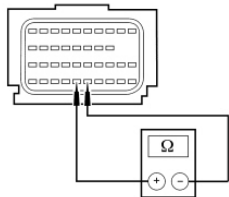

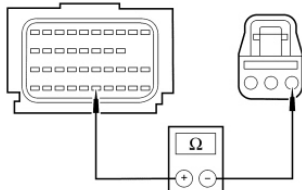

Test Step	Result / Action to Take
<b>J1 RETRIEVE SRS DTCs</b>	

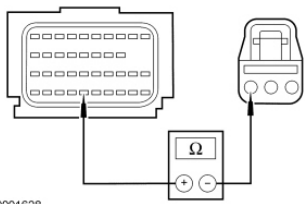

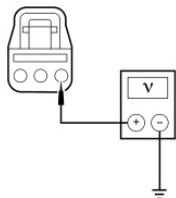

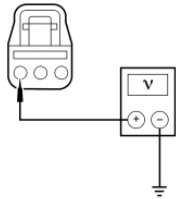

<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2292 Fault PIDs. <ul style="list-style-type: none"> <li>◆ Refer to PID list in Normal Operation to view 2292 fault PIDs.</li> </ul> </li> <li>• <b>Do any 2292 fault PIDs indicate a fault?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test. GO to <u>J2</u> .</p> <p><b>No</b> This is an intermittent fault when present as a CMDTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to <u>J18</u> .</p>
<p><b>J2 CHECK THE SAFETY BELT RETRACTOR PRETENSIONER</b></p>

<b>J19 CHECK FOR ADDITIONAL SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.</b></li> <li>• Reconnect all SRS components (if previously disconnected).</li> <li>• If previously directed to depower the SRS , repower the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Are any DTCs retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> Do not clear any DTCs until all DTCs have been resolved. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

**Pinpoint Test K: DTC B2293**

Refer to Wiring Diagrams Cell **46** , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Codes (LFCs) indicate the specific fault PIDs associated with DTC B2293:

<b>LFC</b>	<b>Description</b>	<b>LFC</b>	<b>Description</b>
1-9	Driver Air Bag Squib 1 Open/High Resistance Fault	8-7	Driver Air Bag Squib 1 Short to Battery Fault
2-1	Passenger Air Bag Squib 1 Open/High Resistance Fault	8-8	Driver Air Bag Squib 2 Short to Battery Fault
8-1	Driver Air Bag Squib 2 Open/High Resistance Fault	8-9	Passenger Air Bag Squib 1 Short to Battery Fault
8-2	Passenger Air Bag Squib 2 Open/High Resistance Fault	8-10	Passenger Air Bag Squib 2 Short to Battery Fault
8-3	Driver Air Bag Squib 1 Short to Ground Fault	8-11	Driver Air Bag Squib 1 Low Resistance Fault
8-4	Driver Air Bag Squib 2 Short to Ground Fault	8-12	Driver Air Bag Squib 2 Low Resistance Fault
8-5	Passenger Air Bag Squib 1 Short to Ground Fault	8-13	Passenger Air Bag Squib 1 Low Resistance Fault
8-6	Passenger Air Bag Squib 2 Short to Ground Fault	8-14	Passenger Air Bag Squib 2 Low Resistance Fault

### Normal Operation

The Restraints Control Module (RCM) monitors all front air bag module circuits for faults. The RCM will set a DTC if a short to battery or short to ground fault is detected. The RCM will also set a DTC if the loop resistance is less than 0.9 ohm or greater than 5.0 ohms. If the RCM detects a fault on any of the front air bag circuits, it will store DTC B2293 in memory and depending on the fault, flash a LFC on the air bag warning indicator.

<b>Fault PIDs <sup>a</sup></b>	<b>Description</b>	<b>Fault Trigger Condition</b>
2293_16_OD and 2293_16_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side	When the Restraints Control Module (RCM) measures resistance less than 0.9 ohm between the passenger air bag loop circuits, a fault will be indicated.
2293_17_OD and 2293_17_CM	Air Bag Circuit Open - Loop No. 2, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger air bag loop circuits, a fault will be indicated.
2293_18_OD and 2293_18_CM	Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side	When the RCM senses a short to voltage on either passenger air bag loop circuit, a fault will be indicated.
2293_19_OD and 2293_19_CM	Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side	When the RCM senses a short to ground on either passenger air bag loop circuit, a fault will be indicated.
2293_20_OD and 2293_20_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver air bag loop circuits, a fault will be indicated.
2293_21_OD and 2293_21_CM	Air Bag Circuit Open - Loop No. 2, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver air bag loop circuits, a fault will be indicated.
2293_22_OD and 2293_22_CM	Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side	When the RCM senses a short to voltage on either driver air bag loop circuit, a fault will be indicated.

2293_23_OD and 2293_23_CM	Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side	When the RCM senses a short to ground on either driver air bag loop circuit, a fault will be indicated.
2293_24_OD and 2293_24_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger air bag loop circuits, a fault will be indicated.
2293_25_OD and 2293_25_CM	Air Bag Circuit Open - Loop No. 1, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger air bag loop circuits, a fault will be indicated.
2293_26_OD and 2293_26_CM	Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side	When the RCM senses a short to voltage on either passenger air bag loop circuit, a fault will be indicated.
2293_27_OD and 2293_27_CM	Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side	When the RCM senses a short to ground on either passenger air bag loop circuit, a fault will be indicated.
2293_28_OD and 2293_28_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver air bag loop circuits, a fault will be indicated.
2293_29_OD and 2293_29_CM	Air Bag Circuit Open - Loop No. 1, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver air bag loop circuits, a fault will be indicated.
2293_30_OD and 2293_30_CM	Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side	When the RCM senses a short to voltage on either driver air bag loop circuit, a fault will be indicated.
2293_31_OD and 2293_31_CM	Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side	When the RCM senses a short to ground on either driver air bag loop circuit, a fault will be indicated.

<sup>a</sup> Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2293. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2293.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Clockspring
- Driver/Passenger air bag module
- RCM

**PINPOINT TEST K: DTC B2293**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .**

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>K1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2293 Fault PIDs. <ul style="list-style-type: none"> <li>Refer to PID list in Normal Operation to view 2293 fault PIDs.</li> </ul> </li> <li><b>Do any 2293 fault PIDs indicate a fault?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test. GO to <b>K2</b> .</p> <p><b>No</b> This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to <b>K38</b> .</p>
<b>K2 CHECK THE DRIVER AND PASSENGER AIR BAG MODULES</b>	
<ul style="list-style-type: none"> <li>Ignition OFF.</li> <li>Depower the SRS . Do not remove or defeat the shorting bar. REPAIR circuit 614 (GY/OG) or 615 (GY/WH). GO to <u>K39</u> .</p>
<p><b>K5 CHECK CIRCUITS 614 (GY/OG) AND 615 (GY/WH) FOR A SHORT TO VOLTAGE</b></p>	

# **BETWEEN THE RCM AND DRIVER AIR BAG MODULE LOOP 1**

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Driver Air Bag Module Loop 1 Restraint System Diagnostic Tool.
- Disconnect: RCM C310a and C310b.
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Measure the voltage between driver air module loop 1 electrical connector, pin 1, harness side and ground; and between driver air module loop 1 electrical connector, pin 2, harness side and ground.

A0088715

- **Is voltage present on either circuit?**

**Yes**  
GO to K6 .

**No**  
GO to K37 .

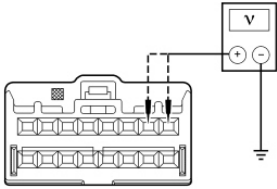

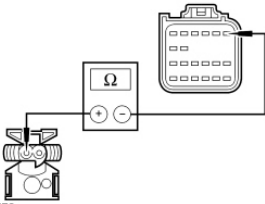

## **K6 CHECK CIRCUITS 614 (GY/OG) AND 615 (GY/WH) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPring**

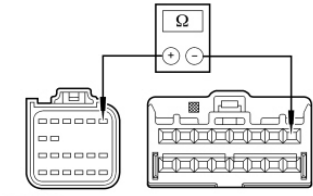

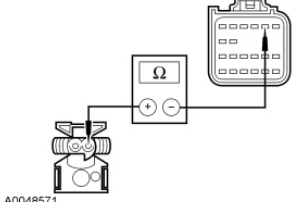

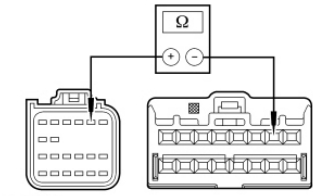

- Ignition OFF.
- Disconnect: Clockspring C218a.
- **NOTE:** Remove the steering column lower shroud to access clockspring C218a.
- Ignition ON.
- Measure the voltage between clockspring C218a-1, circuit 614 (GY/OG), harness side and ground; and between clockspring C218a-2, circuit 615 (GY/WH), harness side and ground.

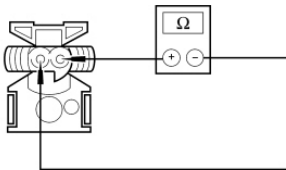

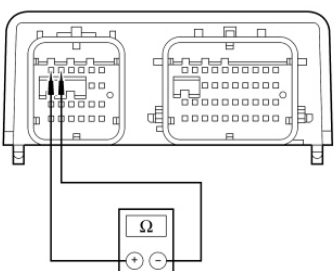

**Yes**  
Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit 614 (GY/OG) or 615 (GY/WH). GO to K39 .

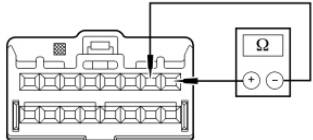

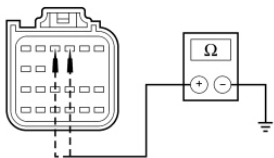

**No**  
INSTALL a new clockspring. REFER to Clockspring in this section. GO to K39 .

A0041281

- Is the resistance less than 800 ohms?

**K37 CONFIRM THE RCM FAULT**

**NOTE:** Make sure all restraint system diagnostic tools, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the self test. If not, DTCs will be recorded.

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Connect: Restraint System Diagnostic Tools.
- Connect: RCM C310a and C310b.
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test - RCM .
- **Was DTC B2293 retrieved on-demand during self-test?**

**Yes**

INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to K39 .

**No**

CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminals or connector concerns found. GO to K39 .

**K38 CHECK FOR AN INTERMITTENT FAULT**

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- If the fault was reported for the driver air bag module:
  - ◆ Remove the driver air bag module. Refer to Driver Air Bag Module in this section.

**Yes**

The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test. CHECK for causes of the intermittent fault at or near the affected air bag module connector. REPAIR any intermittent wiring, terminals or connector concerns found.

If an intermittent concern **was** found and repaired, GO to K39 .

- ◆ Connect restraint system diagnostic tools 418-F395 (2 required) to the driver air bag module loop 1 and loop 2 connectors.
- **NOTE:** Detach and disconnect the passenger air bag module jumper harness and connect the restraint system diagnostic tools, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
- If the fault was reported for the passenger air bag module:
  - ◆ Remove the passenger air bag module. Refer to Passenger Air Bag Module in this section.
  - ◆ Disconnect and remove the passenger air bag module jumper harness from the passenger air bag module.
  - ◆ Connect restraint system diagnostic tools 418-F395 (2 required) to the passenger air bag module jumper harness electrical connectors.
  - ◆ Connect the passenger air bag module jumper harness with restraint system diagnostic tools to passenger air bag module C256.

- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test - RCM .
- Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2293 Fault PIDs.
  - ◆ Refer to PID list in Normal Operation to view 2293 fault PIDs.
- **Do any 2293 fault PIDs indicate a fault?**

If an intermittent concern **was not** found and repaired, USE the fault PIDs recorded and GO to the appropriate pinpoint test step.

For 2293\_31\_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) ( LFC 8-3), GO to K3 .

For 2293\_30\_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) ( LFC 8-7), GO to K5 .

For 2293\_29\_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) ( LFC 1-9), GO to K7 .

For 2293\_28\_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) ( LFC 8-11), GO to K11 .

For 2293\_27\_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) ( LFC 8-5), GO to K14 .

For 2293\_26\_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) ( LFC 8-9), GO to K15 .

For 2293\_25\_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) ( LFC 2-1), GO to K16 .

For 2293\_24\_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) ( LFC 8-13), GO to K18 .

For 2293\_23\_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side) ( LFC 8-4), GO to K20 .

For 2293\_22\_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side) ( LFC 8-8), GO to K22 .

For 2293\_21\_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side) ( LFC 8-1), GO to K24 .

For 2293\_20\_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side) ( LFC 8-12), GO to K28 .

For 2293\_19\_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side) ( LFC 8-6), GO to K31 .

	<p>For 2293_18_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side) ( LFC 8-10), GO to <u>K32</u> .</p> <p>For 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side) ( LFC 8-2), GO to <u>K33</u> .</p> <p>For (2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side) ( LFC 8-14), GO to <u>K35</u> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. <b>Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.</b> REPAIR any intermittent wiring, terminals or connector concerns found. GO to <u>K39</u> .</p>
<b>K39 CHECK FOR ADDITIONAL SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.</b></li> <li>• Reconnect all SRS components (if previously disconnected).</li> <li>• If previously directed to depower the SRS , repower the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Are any DTCs retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> Do not clear any DTCs until all DTCs have been resolved. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

**Pinpoint Test L: DTC B2295**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Codes (LFCs) indicate the specific fault PIDs associated with DTC B2295:

LFC	Description	LFC	Description
2-2	Driver Seat Side Air Bag Open/High Resistance Fault	9-5	Driver Seat Side Air Bag Short to Battery Fault
2-3	Passenger Seat Side Air Bag Open/High Resistance Fault	9-6	Passenger Seat Side Air Bag Short to Battery Fault
9-1	Driver Seat Side Air Bag Short to Ground Fault	9-9	Driver Seat Side Air Bag Low Resistance Fault
9-2	Passenger Seat Side Air Bag Short to Ground Fault	9-10	Passenger Seat Side Air Bag Low Resistance Fault

### Normal Operation

A seat side air bag module provides protection of the thorax area (between the neck and abdomen) of the body. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The Restraints Control Module (RCM) monitors all seat side air bag module circuits for faults. The RCM will set a DTC if a short to battery, open or short to ground fault is detected. The RCM will also set a DTC if the loop resistance is less than 0.9 ohm or greater than 5.0 ohms. If the RCM detects one of the following faults on any of the seat side air bag circuits, it will store DTC B2295 in memory and, depending on the fault, flash a LFC on the air bag warning indicator.

Fault PIDs <sup>a</sup>	Description	Fault Trigger Condition
2295_24_OD and 2295_24_CM	Side Air Bag Circuit Resistance Low, Front Passenger Side	When the Restraints Control Module (RCM) measures resistance less than 0.9 ohm between the passenger side air bag module circuits, a fault will be indicated.
2295_25_OD and 2295_25_CM	Side Air Bag Circuit Open, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger side air bag module circuits, a fault will be indicated.
2295_26_OD and 2295_26_CM	Side Air Bag Circuit Short to Ground, Front Passenger Side	When the RCM senses a short to ground on either passenger side air bag module circuit, a fault will be indicated.
2295_27_OD and 2295_27_CM	Side Air Bag Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on either passenger side air bag module circuit, a fault will be indicated.
2295_28_OD and 2295_28_CM	Side Air Bag Circuit Resistance Low, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver side air bag module circuits, a fault will be indicated.
2295_29_OD and 2295_29_CM	Side Air Bag Circuit Open, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver side air bag module circuits, a fault will be indicated.
2295_30_OD and 2295_30_CM	Side Air Bag Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on either driver side air bag module circuit, a fault will be indicated.

2295_31_OD and 2295_31_CM	Side Air Bag Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on either driver side air bag module circuit, a fault will be indicated.
------------------------------	--	--

<sup>a</sup> Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2295. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2295.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Seat side air bag module
- RCM

#### PINPOINT TEST L: DTC B2295

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

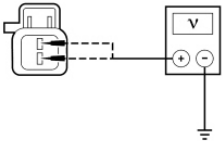

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

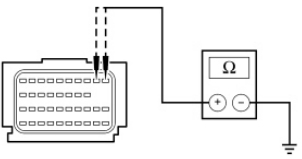

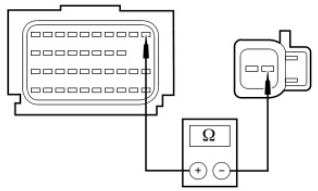

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

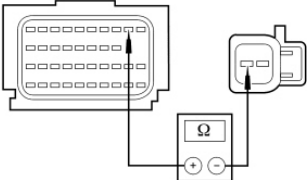

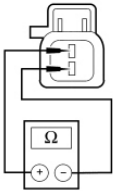

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>L1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2295 Fault PIDs. <ul style="list-style-type: none"> <li>◆ Refer to PID list in Normal Operation to view 2295 fault PIDs.</li> </ul> </li> <li>• <b>Do any 2295 fault PIDs indicate a fault?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test. GO to <u>L2</u> .</p> <p><b>No</b> This is an intermittent fault when present as a CMDTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to <u>L16</u> .</p>
<b>L2 CHECK THE DRIVER AND PASSENGER SEAT SIDE AIR BAG MODULES</b>	

<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the SRS . A0041286

- Is the resistance less than 800 ohms?

**L9 CHECK CIRCUITS 1259 (WH/YE) AND 1260 (BN/YE) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER SEAT SIDE AIR BAG MODULE**

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Passenger Seat Side Air Bag Module Restraint System Diagnostic Tool .
- Disconnect: RCM C310a and C310b.
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Measure the voltage between passenger seat side air bag module C316-1, circuit 1259 (WH/YE), harness side and ground; and between passenger seat side air bag module C316-2, circuit 1260 (BN/YE), harness side and ground.

N0059342

- Is voltage present on either circuit?

**L10 CHECK CIRCUITS 1259 (WH/YE) AND 1260 (BN/YE) FOR A SHORT TO**

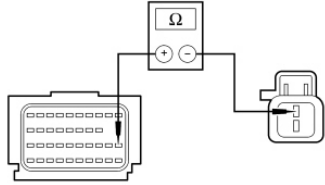

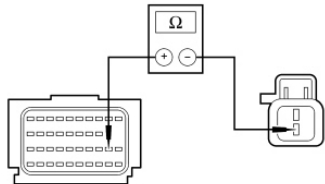

**Yes**

Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bars. REPAIR circuit 1259 (WH/YE) or 1260 (BN/YE). GO to L17 .

**No**

GO to L15 .

A0029887

- Is the resistance less than 800 ohms?

#### L14 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b.
- Measure the resistance between RCM C310b pins 21 and 22, component side.

A0041291

- Is the resistance less than 800 ohms?

#### L15 CONFIRM THE RCM FAULT

**NOTE:** Make sure all restraint system diagnostic tools, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the self test. If not, DTCs will be recorded.

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Connect: Restraint System Diagnostic Tools.
- Connect: RCM C310a and C310b.
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.

#### Yes

GO to L15 .

#### No

REPAIR circuits 1259 (WH/YE) and 1260 (BN/YE). GO to L17 .

#### Yes

INSTALL a new RCM . REFER to Restraints Control Module (RCM) . GO to L17 .

#### No

CHECK for causes of the intermittent fault.

ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness.

**Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminals or connector concerns found. GO to L17 .

<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record 2295 Fault PIDs.</li> <li>• <b>Was DTC B2295 retrieved on-demand during self-test?</b></li> </ul>

	<p>ACTIVATE others systems in the same wire harness.</p> <p><b>Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.</b> REPAIR any intermittent wiring, terminals or connector concerns found. GO to <u>L17</u> .</p>
<b>L17 CHECK FOR ADDITIONAL SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• <b>⚠ WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.</b></li> <li>• Reconnect all SRS components (if previously disconnected).</li> <li>• If previously directed to depower the SRS , repower the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Are any DTCs retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b></p> <p>Do not clear any DTCs until all DTCs have been resolved. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b></p> <p>CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

### Pinpoint Test M: DTC B2296

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

### Lamp Fault Codes (LFCs)

The following Lamp Fault Codes (LFCs) indicate the specific fault PIDs associated with DTC B2296:

LFC	Description	LFC	Description
4-2	LH Front Impact Severity Sensor Communication Fault	4-3	Driver Side Impact Sensor Communication Fault
4-4	Passenger Side Impact Sensor Communication Fault	4-11	LH Front Impact Severity Sensor Mounting Fault
4-12	Driver Side Impact Sensor Mounting Fault	4-13	Passenger Side Impact Sensor Mounting Fault
6-1	LH Impact Severity Sensor Internal Fault	6-2	Driver Side Impact Sensor Internal Fault
6-3	Passenger Side Impact Sensor Internal Fault	6-6	LH Front Impact Severity Sensor Short to Ground Fault
6-7		6-8	

	Driver Side Impact Sensor Short to Ground Fault		Passenger Side Impact sensor Short to Ground Fault
6-11	LH Front Impact Severity Sensor Short to Battery Fault	6-12	Driver Side Impact Sensor Short to Battery Fault
6-13	Passenger Side Impact Sensor Short to Battery Fault	12-2	RH Front Impact Severity Sensor Mounting Fault
12-3	RH Front Impact Severity Sensor Internal Fault	12-4	RH Front Impact Severity Sensor Communication Fault
12-5	RH Front Impact Severity Sensor Short to Ground Fault	12-6	RH Front Impact Severity Sensor Short to Battery Fault

### Normal Operation

The impact sensor(s) provide data to the Restraints Control Module (RCM) for use in calculating impact severity. This is accomplished using various electrical and electro-mechanical sensor(s) throughout the vehicle.

The RCM checks all of the impact sensor circuits for faults. If the RCM detects one of the following faults on any of the impact sensor circuits, it will store DTC B2296 in memory and, depending on the fault, flash a LFC on the air bag warning indicator.

Fault PIDs <sup>a</sup>	Description	Fault Trigger Condition
2296_3_OD and 2296_3_OD	Driver/Center Front Crash Sensor Circuit Short to Battery	When the Restraints Control Module (RCM) senses a short to voltage on the driver/center front impact sensor circuits, a fault will be indicated.
2296_4_OD and 2296_4_OD	Driver/Center Front Crash Sensor Circuit Short to Ground	When the RCM senses a short to ground on the driver/center front impact sensor circuits, a fault will be indicated.
2296_5_OD and 2296_5_OD	Driver/Center Front Crash Sensor Communication Fault	When the RCM is unable to communicate with the driver/center front impact sensor, a fault will be indicated.
2296_12_OD and 2296_12_CM	Side Crash Sensor Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on the passenger side first row impact sensor circuits, a fault will be indicated.
2296_13_OD and 2296_13_CM	Side Crash Sensor Circuit Short to Ground, Front Passenger Side	When the RCM senses a short to ground on the passenger side first row impact sensor circuits, a fault will be indicated.
2296_14_OD and 2296_14_CM	Side Crash Sensor Communication Fault, Front Passenger Side	When the RCM is unable to communicate with the passenger side first row impact sensor, a fault will be indicated.
2296_15_OD and 2296_15_CM	Side Crash Sensor Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on the driver side first row impact sensor circuits, a fault will be indicated.
2296_16_OD and 2296_16_CM	Side Crash Sensor Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on the driver side first row impact sensor circuits, a fault will be indicated.

2296_17_OD and 2296_17_CM	Side Crash Sensor Communication Fault, Front Driver Side	When the RCM is unable to communicate with the driver side first row impact sensor, a fault will be indicated.
2296_18_OD and 2296_18_CM	Driver/Center Front Crash Sensor Internal Fault	When the RCM senses a internal failure with the driver/center front impact sensor, a fault will be indicated.
2296_19_OD and 2296_19_CM	Driver/Center Front Crash Sensor Mount or Communication Fault	When the RCM is unable to communicate with the driver/center front impact sensor, a fault will be indicated.
2296_28_OD and 2296_28_CM	Side Crash Sensor Internal Fault, Front Passenger Side	When the RCM senses a internal failure with the passenger side first row impact sensor, a fault will be indicated.
2296_29_OD and 2296_29_CM	Side Crash Sensor Mount or Communication Fault, Front Passenger Side	When the RCM is unable to communicate with the driver side first row impact sensor, a fault will be indicated.
2296_30_OD and 2296_30_CM	Side Crash Sensor Internal Fault, Front Driver Side	When the RCM senses a internal failure with the driver/center front impact sensor, a fault will be indicated.
2296_31_OD and 2296_31_CM	Side Crash Sensor Mount or Communication Fault, Driver Front	When the RCM is unable to communicate with the driver side first row impact sensor, a fault will be indicated.
2296_55_OD and 2296_55_OD	Passenger Front Crash Sensor Circuit Short to Battery	When the RCM senses a short to voltage on the passenger front impact sensor circuits, a fault will be indicated.
2296_56_OD and 2296_56_OD	Passenger Front Crash Sensor Circuit Short to Ground	When the RCM senses a short to ground on the passenger front impact sensor circuits, a fault will be indicated.
2296_57_OD and 2296_57_CM	Passenger Front Crash Sensor Communication Fault	When the RCM is unable to communicate with the driver side first row impact sensor, a fault will be indicated.
2296_58_OD and 2296_58_CM	Passenger Front Crash Sensor Internal Fault	When the RCM senses a internal failure with the passenger front impact sensor, a fault will be indicated.
2296_59_OD and 2296_59_CM	Passenger Front Crash Sensor Mount or Communication Fault	When the RCM is unable to communicate with the passenger front impact sensor, a fault will be indicated.

<sup>a</sup> Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2296. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2296.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Impact sensor
- Incorrect sensor mounting
- RCM

**PINPOINT TEST M: DTC B2296**

**⚠ WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to**

**follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.**

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

**NOTE:** Do not probe any impact sensor. The impact sensor can not be tested using a multi-meter.

Test Step	Result / Action to Take
<b>M1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs. <ul style="list-style-type: none"> <li>◆ Refer to PID list in Normal Operation to view 2296 fault PIDs.</li> </ul> </li> <li>• <b>Do any 2296 fault PIDs indicate a fault?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test.</p> <p>Using the fault PIDs recorded, GO to the appropriate pinpoint test step.</p> <p>For 2296_31_OD (Side Crash Sensor Mount or Communication Fault, Front Driver Side) ( LFC 4-12), GO to <u>M2</u> .</p> <p>For 2296_17_OD (Side Crash Sensor Communication Fault, Front Driver Side) ( LFC 4-3), GO to <u>M8</u> .</p> <p>For 2296_30_OD (Side Crash Sensor Internal Fault, Front Driver Side) ( LFC 6-2), INSTALL a new driver side impact sensor. REFER to <u>Side Impact Sensor</u> in this section. GO to <u>M44</u> .</p> <p>For 2296_16_OD (Side Crash Sensor Circuit Short to Ground, Front Driver Side) ( LFC 6-7), GO to <u>M7</u> .</p> <p>For 2296_15_OD (Side Crash Sensor Circuit Short to Battery, Front Driver Side) ( LFC 6-12), GO to <u>M6</u> .</p> <p>For 2296_29_OD (Side Crash Sensor Mount or Communication Fault, Front Passenger Side) ( LFC 4-13), GO to <u>M12</u> .</p>

For 2296\_14\_OD (Side Crash Sensor Communication Fault, Front Passenger Side) ( LFC 4-4), GO to M18 .

For 2296\_28\_OD (Side Crash Sensor Internal Fault, Front Passenger Side) ( LFC 6-3), INSTALL a new first row passenger side impact sensor. REFER to Side Impact Sensor in this section. GO to M44 .

For passenger side impact sensor with a short to ground fault (2296\_13\_OD (Side Crash Sensor Circuit Short to Ground, Front Passenger Side) ( LFC 6-8), GO to M17 .

For 2296\_12\_OD (Side Crash Sensor Circuit Short to Battery, Front Passenger Side) ( LFC 6-13), GO to M16 .

For 2296\_19\_OD (Driver/Center Front Crash Sensor Mount/Communication Fault) ( LFC 4-11), GO to M22 .

For 2296\_5\_OD (Driver/Center Front Crash Sensor Communication Fault) ( LFC 4-2), GO to M28 .

For 2296\_18\_OD (Driver/Center Front Crash Sensor Internal Fault) ( LFC 6-1), INSTALL a new front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to M44 .

For 2296\_4\_OD (Driver/Center Front Crash Sensor Circuit Short to Ground) ( LFC 6-6), GO to M27 .

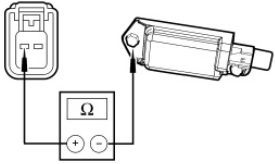

For 2296\_3\_OD (Driver/Center Front Crash Sensor Circuit Short to Battery) ( LFC 6-11), GO to M26 .

For RH front impact severity sensor with a mounting fault (2296\_59\_OD) ( LFC 12-2), GO to M32 .

For 2296\_57\_OD (Passenger Front Crash Sensor Communication Fault) ( LFC 12-4), GO to M38 .

For 2296\_58\_OD (Passenger Front Crash Sensor Internal Fault) ( LFC 12-3), INSTALL a new RH front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to M44 .

	<p>For 2296_56_OD (Passenger Front Crash Sensor Circuit Short to Ground) ( LFC 12-5), GO to <u>M37</u> .</p> <p>For 2296_55_OD (Passenger Front Crash Sensor Circuit Short to Battery) ( LFC 12-6), GO to <u>M36</u> .</p> <p><b>No</b> This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to <u>M43</u> .</p>
<b>M2 INSPECT THE DRIVER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the SRS . Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Access the driver side impact sensor. Refer to <u>Side Impact Sensor</u> in this section.</li> <li>• Inspect the driver side impact sensor for: <ul style="list-style-type: none"> <li>◆ a loose electrical connector.</li> <li>◆ loose sensor mounting bolts.</li> </ul> </li> <li>• Remove the driver side impact sensor. Refer to <u>Side Impact Sensor</u> in this section.</li> <li>• Inspect the driver side impact sensor, alignment tabs, electrical connector and mounting surface for damage, corrosion or dirt.</li> <li>• <b>Was a significant amount of damage, corrosion or dirt found, was the driver side impact sensor attached to the mounting surface incorrectly or were the impact sensor bolts not fully seated and tightened correctly?</b></li> </ul>	<p><b>Yes</b> CLEAN and TIGHTEN the bolts to the required specification. REPAIR the mounting surface and electrical connections as necessary. REINSTALL the driver side impact sensor. GO to <u>M44</u> .</p> <p><b>No</b> GO to <u>M3</u> .</p>
<b>M3 INSTALL THE DRIVER SIDE IMPACT SENSOR AND CARRY OUT THE SELF TEST</b>	
<ul style="list-style-type: none"> <li>• Clean and repair the mounting surface as necessary.</li> <li>• Clean the driver side impact sensor mounting bolts.</li> <li>• Install the driver side impact sensor and tighten to the required specification.</li> <li>• Repower the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All</li> </ul>	<p><b>Yes</b> GO to <u>M4</u> .</p> <p><b>No</b> Fault corrected. GO to <u>M44</u> .</p>

<p>2296 Fault PIDs.</p> <ul style="list-style-type: none"> <li>◆ Refer to PID list in Normal Operation to view 2296 fault PIDs.</li> <li>• <b>Do any 2296 fault PIDs indicate a fault?</b></li> </ul>	
<p><b>M4 CHECK THE DRIVER SIDE IMPACT SENSOR GROUND CIRCUIT 1262 (BN/LG) FOR HIGH RESISTANCE</b></p>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the SRS . Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Disconnect: Driver Side Impact Sensor C305.</li> <li>• Measure the resistance between driver side impact sensor C305-2, circuit 1262 (BN/LG), harness side and the driver side impact sensor case ground bolt.</li> </ul>  <p>A0051256</p> <ul style="list-style-type: none"> <li>• <b>Is the resistance less than 100 ohms?</b></li> </ul>	<p><b>Yes</b> GO to <u>M11</u> .</p> <p><b>No</b> GO to <u>M5</u> .</p>
<p><b>M5 CLEAN THE DRIVER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE SELF TEST</b></p>	
<ul style="list-style-type: none"> <li>• Remove the driver side impact sensor. Refer to <u>Side Impact Sensor</u> in this section.</li> <li>• Clean and repair the mounting surface as necessary.</li> <li>• Clean the driver side impact sensor mounting bolts.</li> <li>• Install the driver side impact sensor and tighten to specifications.</li> <li>• Repower the SRS . <b>Do not</b> prove out the SRS at this time. GO to <u>M44</u> .</p>

**M6 CHECK CIRCUITS 1261 (WH/LG) AND 1262 (BN/LG) FOR A SHORT TO VOLTAGE BETWEEN THE DRIVER SIDE IMPACT SENSOR AND RCM**

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Driver Side Impact Sensor C305.
- Disconnect: RCM C310a and C310b.
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Measure the voltage between driver side impact sensor C305-2, circuit 1262 (BN/LG), harness side and ground; and between C305-1, circuit 1261 (WH/LG), harness side and ground.

A0029894

- Is voltage present on either circuit?

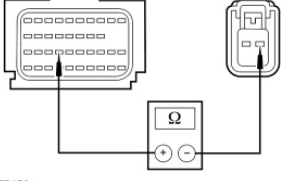

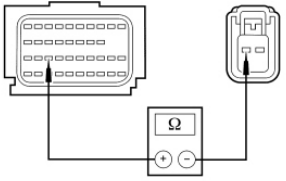

**Yes**REPAIR circuit 1261 (WH/LG) or 1262 (BN/LG). GO to M44 .**No**GO to M11 .
**M7 CHECK CIRCUITS 1261 (WH/LG) AND 1262 (BN/LG) FOR A SHORT TO GROUND BETWEEN THE DRIVER SIDE IMPACT SENSOR AND RCM**

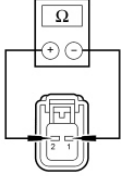

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Driver Side Impact Sensor C305.
- Disconnect: RCM C310a and C310b.
- Measure the resistance between driver side impact sensor:
  - ♦ C305-2, circuit 1262 (BN/LG), harness side and ground.
  - ♦ C305-1, circuit 1261 (WH/LG), harness side and ground.

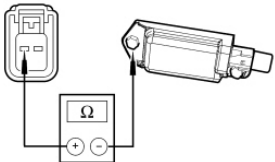

A0029893

**Yes**GO to M11 .**No**REPAIR circuit 1261 (WH/LG) or 1262 (BN/LG). GO to M44 .

<ul style="list-style-type: none"> <li>• Are the resistances greater than 10,000 ohms?</li> </ul>	
<b>M8 CHECK CIRCUIT 1261 (WH/LG) FOR AN OPEN BETWEEN THE RCM AND DRIVER SIDE IMPACT SENSOR</b>

**M17 CHECK CIRCUITS 1264 (BN) AND 1263 (WH)  
FOR A SHORT TO GROUND BETWEEN THE  
PASSENGER SIDE IMPACT SENSOR AND RCM**

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Passenger Side Impact Sensor C304.
- Disconnect: RCM C310a and C310b.
- Measure the resistance between passenger side impact sensor:
  - ◆ C304-2, circuit 1264 (BN), harness side and ground.
  - ◆ C304-1, circuit 1263 (WH), harness side and ground.

A0029893

- Are the resistances greater than 10,000 ohms?

**Yes**GO to M21 .**No**REPAIR circuit 1264 (BN) or 1263 (WH).  
GO to M44 .
**M18 CHECK CIRCUIT 1264 (BN) FOR AN OPEN  
BETWEEN THE RCM AND PASSENGER SIDE  
IMPACT SENSOR**

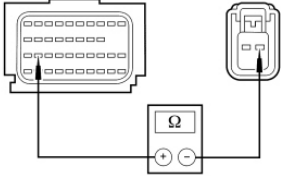

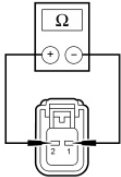

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Passenger Side Impact Sensor C304.
- Disconnect: RCM C310a and C310b.
- Measure the resistance between RCM C310b-30, circuit 1264 (BN), harness side and passenger side impact sensor C304-2, circuit 1264 (BN), harness side.

A0077458

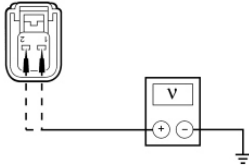

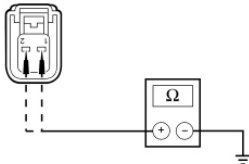

- Is the resistance less than 0.5 ohm?

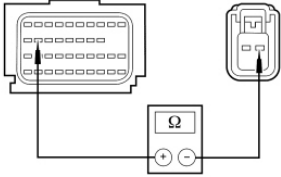

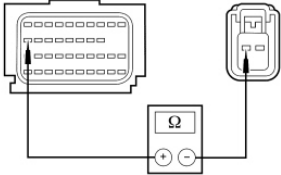

**Yes**GO to M19 .**No**REPAIR circuit 1264 (BN). GO to M44 .
**M19 CHECK CIRCUIT 1263 (WH) FOR AN OPEN  
BETWEEN THE RCM AND PASSENGER SIDE  
IMPACT SENSOR**

A0049598

- Is the resistance greater than 10,000 ohms?

### M31 CHECK THE LH FRONT IMPACT SEVERITY SENSOR

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Connect: RCM C310a and C310b.
- Install a known good LH front impact severity sensor. Refer to Front Impact Severity Sensor in this section.
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test - RCM .
- Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs.
  - ◆ Refer to PID list in Normal Operation to view 2296 fault PIDs.
- **Were any on-demand fault PIDs for the LH front impact severity sensor indicating a fault?**

**Yes**  
GO to M42 .

**No**  
Fault corrected. GO to M44 .

### M32 INSPECT THE RH FRONT IMPACT SEVERITY SENSOR MOUNTING AND MOUNTING SURFACE

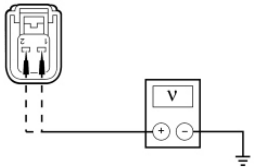

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Access the RH front impact severity sensor. Refer to Front Impact Severity Sensor in this section.
- Inspect the RH front impact severity sensor for:
  - ◆ a loose electrical connector.
  - ◆ loose sensor mounting bolts.
- Remove the RH front impact severity sensor. Refer to Front Impact Severity Sensor in this section.
- Inspect the RH front impact severity sensor, alignment tabs, electrical connector and mounting surface for damage, corrosion or dirt.
- **Was a significant amount of damage, corrosion or dirt found, was the RH front severity impact**

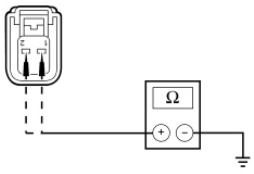

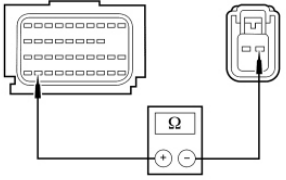

**Yes**  
CLEAN and TIGHTEN bolts to the required specification, or REPAIR the mounting surface as necessary. REINSTALL the RH front impact severity sensor. GO to M44 .

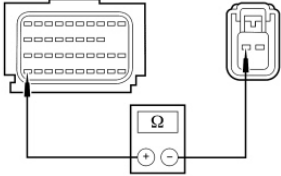

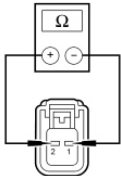

**No**  
GO to M33 .

sensor attached to the mounting surface incorrectly or were the sensor bolts not fully seated and tightened correctly?	
<b>M33 INSTALL THE RH FRONT IMPACT SEVERITY SENSOR AND CARRY OUT THE SELF TEST</b>	
<ul style="list-style-type: none"> <li>• Clean and repair the mounting surface as necessary.</li> <li>• Clean the RH front impact severity sensor mounting bolts.</li> <li>• Install the RH front impact severity sensor. |--|--|
| <ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Are any DTCs retrieved on-demand during self-test?</b></li> </ul> |  |
|--|--|

**Pinpoint Test N: DTC B2432**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2432:

- LFC 5-1 - Driver Seat Belt Buckle Switch Circuit Open

**Normal Operation**

The safety belt buckles are equipped with Hall-effect switches. The safety belt buckle switches indicate to the Restraints Control Module (RCM) whether the safety belts are buckled or unbuckled.

The RCM checks the driver safety belt buckle switch circuits for faults. If the RCM detects an open circuit, it will store DTC B2432 in memory, flash LFC 5-1 on the air bag warning indicator.

- DTC B2432 (Driver Seat Belt Buckle Switch Circuit Open) - If the RCM detects an open circuit on the driver safety belt buckle switch, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

**PINPOINT TEST N: DTC B2432**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

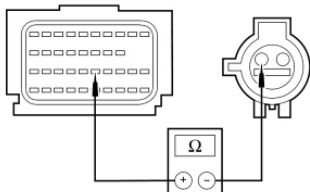

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

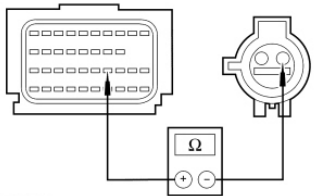

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>N1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC B2432 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test. GO to <u>N2</u> .</p> <p><b>No</b> This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to <u>N6</u> .</p>
<b>N2 CHECK CIRCUIT 85 (BN/LB) FOR AN OPEN</b>	
<ul style="list-style-type: none"> <li>Ignition OFF.</li> <li>Depower the SRS . GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

**Pinpoint Test O: DTC B2433**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2433:

- LFC 7-9 - Driver Seat Belt Buckle Switch Circuit Short to Battery

**Normal Operation**

The safety belt buckles are equipped with Hall-effect switches. The safety belt buckle switches indicate to the Restraints Control Module (RCM) whether the safety belts are buckled or unbuckled.

The RCM checks the driver safety belt buckle switch circuits for faults. If the RCM detects a short to battery fault, it will store DTC B2433 in memory, flash LFC 7-9 on the air bag warning indicator.

- DTC B2433 (Drivers Seat Belt Buckle Switch Short to Battery) - If the RCM detects a short to voltage on the driver safety belt buckle circuit, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- RCM

#### PINPOINT TEST O: DTC B2433

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

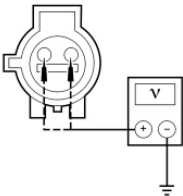

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

### Pinpoint Test P: DTC B2434

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2434:

- LFC 7-1 - Driver Seat Belt Buckle Switch Circuit Short to Ground

#### Normal Operation

The safety belt buckles are equipped with Hall-effect switches. The safety belt buckle switch indicates to the Restraints Control Module (RCM) whether the safety belt is buckled or unbuckled.

The RCM checks the driver safety belt buckle switch circuits for faults. If the RCM detects a short to ground fault, it will store DTC B2434 in memory, flash LFC 7-1 on the air bag warning indicator.

- DTC B2434 (Drivers Seat Belt Buckle Switch Short to Ground) - If the RCM detects a short to ground on the driver safety belt buckle circuit, it will set this DTC.

#### **This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

### PINPOINT TEST P: DTC B2434

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

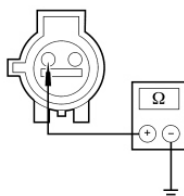

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

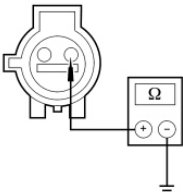

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take

**Pinpoint Test Q: DTC B2435**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2435:

- LFC 7-5 - Driver Seat Belt Buckle Switch Circuit Resistance Out of Range

**Normal Operation**

The safety belt buckles are equipped with Hall-effect switches. The safety belt switches indicate to the Restraints Control Module (RCM) whether the safety belts are connected or disconnected.

The RCM checks the driver safety belt buckle switch circuits for faults. If the RCM detects a current out of range fault, it will store DTC B2435 in memory, flash LFC 7-5 on the air bag warning indicator.

- DTC B2435 (Drivers Seat Belt Buckle Switch Resistance Out of Range) - If the RCM detects a current out of range between buckled and unbuckled on the driver safety belt buckle switch, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Driver safety belt buckle
- RCM

#### PINPOINT TEST Q: DTC B2435

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take

|--|--|

**Pinpoint Test R: DTC B2436**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2436:

- LFC 5-2 - Passenger Seat Belt Buckle Switch Circuit Open

**Normal Operation**

The safety belt buckles are equipped with Hall-effect switches. The safety belt switches indicate to the Restraints Control Module (RCM) whether the safety belts are connected (switch closed) or disconnected (switch open).

The RCM checks the passenger safety belt buckle switch circuits for faults. If the RCM detects an open fault, it will store DTC B2436 in memory, flash LFC 5-2 on the air bag warning indicator.

- DTC B2436 (Passenger Seat Belt Buckle Switch Circuit Open) - If the RCM detects an open circuit on the passenger safety belt buckle switch, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

**PINPOINT TEST R: DTC B2436**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

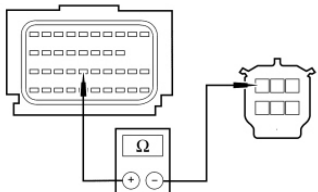

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

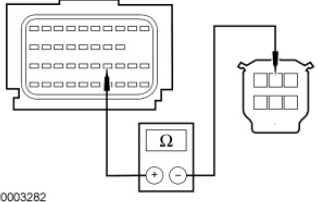

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

**Pinpoint Test S: DTC B2437**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2437:

- LFC 7-10 - Passenger Seat Belt Buckle Switch Circuit Short to Battery

**Normal Operation**

The safety belt buckles are equipped with Hall-effect switches. The safety belt switches indicate to the Restraints Control Module (RCM) whether the safety belts are buckled or unbuckled.

The RCM checks the passenger safety belt buckle switch circuits for faults. If the RCM detects a short to battery fault, it will store DTC B2437 in memory, flash LFC 7-10 on the air bag warning indicator.

- DTC B2437 (Passengers Seat Belt Buckle Switch Short to Battery) - If the RCM detects a short to voltage on the passenger safety belt buckle circuit, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- RCM

**PINPOINT TEST S: DTC B2437**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

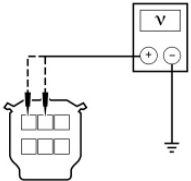

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>S1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Was DTC B2437 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. |--|--|

**Pinpoint Test T: DTC B2438**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2438:

- LFC 7-2 - Passenger Seat Belt Buckle Switch Circuit Short to Ground

**Normal Operation**

The safety belt buckles are equipped with Hall-effect switches. The safety belt switches indicate to the Restraints Control Module (RCM) whether the safety belts are connected or disconnected.

The RCM checks the passenger safety belt buckle switch circuits for faults. If the RCM detects a short to ground fault, it will store DTC B2438 in memory, flash LFC 7-2 on the air bag warning indicator.

- DTC B2438 (Passengers Seat Belt Buckle Switch Short to Ground) - If the RCM detects a short to ground on the passenger safety belt buckle circuit, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

**PINPOINT TEST T: DTC B2438**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

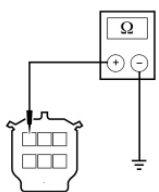

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

### Pinpoint Test U: DTC B2439

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2439:

- LFC 7-6 - Passenger Seat Belt Buckle Switch Circuit Resistance Out of Range

#### Normal Operation

The safety belt buckles are equipped with Hall-effect switches. The safety belt switches indicate to the Restraints Control Module (RCM) whether the safety belts are connected or disconnected. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The RCM checks the passenger safety belt buckle switch circuits for faults. If the RCM detects a current out of range fault, it will store DTC B2439 in memory, flash LFC 7-6 on the air bag warning indicator.

- DTC B2439 (Passengers Seat Belt Buckle Switch Resistance Out of Range) - If the RCM detects a current out of range between buckled and unbuckled on the passenger safety belt buckle switch, it will set this DTC.

#### **This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

### PINPOINT TEST U: DTC B2439

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules,

which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>U1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC B2439 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

**Pinpoint Test V: DTC B2792**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC B2792:

- LFC 12-11 - Cross Link Between Firing Loops

**Normal Operation**

The Restraints Control Module (RCM) monitors all deployable devices for a cross link fault between circuits. If the RCM detects a short between any of the deployable circuits, it will store a diagnostic trouble code B2792 in memory, flash LFC 12-11 on the air bag warning indicator.

Fault PIDs <sup>a</sup>	Description	Fault Trigger Condition
	Side Airbag Passenger	

2792_12_OD and 2792_12_CM		When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_13_OD and 2792_13_CM	Side Airbag Driver	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_26_OD and 2792_26_CM	Pretensioner Passenger	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_27_OD and 2792_27_CM	Pretensioner Driver	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_28_OD and 2792_28_CM	Airbag Passenger Front Loop #2	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_29_OD and 2792_29_CM	Airbag Passenger Front Loop #1	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_30_OD and 2792_30_CM	Airbag Driver Front Loop #2	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_31_OD and 2792_31_CM	Airbag Driver Front Loop #1	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.

<sup>a</sup> Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2792. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2792.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- RCM

**PINPOINT TEST V: B2792**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take																		
<b>V1 RETRIEVE RCM DTCs</b>																			
<ul style="list-style-type: none"><li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li><li>• Enter the following diagnostic mode on the scan tool: Datalogger - RCM - View and Record All 2792 Fault PIDs.</li><li>• <b>Do any 2792 fault PIDs indicate a fault?</b></li></ul>	<p><b>Yes</b> This fault cannot be cleared until it is corrected and the fault PID is no longer retrieved on-demand during self test. PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>
---	--

### Pinpoint Test W: DTC B2909

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

### Lamp Fault Codes (LFCs)

The following Lamp Fault Codes (LFCs) indicate the specific fault PIDs associated with DTC B2909:

- LFC 7-13 - Belt Tension Sensor Open or Short to Battery
- LFC 7-14 - Belt Tension Sensor Short to Ground

### Normal Operation

The Belt Tension Sensor (BTS) operates in conjunction with the Occupant Classification System (OCS) system. The Occupant Classification System Module (OCSM) for the OCS system interprets a variable voltage signal provided by the BTS to identify the possible presence of a child safety seat in the front passenger seat.

The OCS system components (seat cushion foam pad, bladder with pressure sensor and OCSM ) are calibrated to each other and are serviced as an assembly. The OCS system components are not to be installed separately with the exception of the BTS . If a new OCS system, OCS system component or seat cushion foam pad are needed, a new OCS system service kit (seat cushion foam pad, bladder with pressure sensor and OCSM ) must be installed as an assembly.

The OCSM monitors the BTS circuits for faults. If a fault is detected on any of the BTS sensor circuits, it will report the failure to the Restraints Control Module (RCM). The RCM will store DTC B2909 in memory and, depending on the fault, flash a LFC on the air bag warning indicator. The secondary air bag warning chime will also be activated.

Fault PIDs <sup>a</sup>	Description	Fault Trigger Condition
2909_29_OD and 2909_29_CM	Front Passenger Side Belt Tension Sensor Short to Ground	When the Occupant Classification System Module (OCSM) senses a short to ground on the BTS circuits, a fault will be indicated.
2909_31_OD and 2909_31_CM	Front Passenger Side Belt Tension Sensor Circuit Fault	When the OCSM senses a failure on the BTS circuits, a fault will be indicated.

<sup>a</sup> Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2909. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC

B2909.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- BTS
- OCSM

#### PINPOINT TEST W: DTC B2909

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

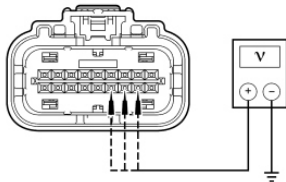

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>W1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2909 Fault PIDs. <ul style="list-style-type: none"> <li>◆ Refer to PID list in Normal Operation to view 2909 fault PIDs.</li> </ul> </li> <li>• <b>Do any 2909 fault PIDs indicate a fault?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test.</p> <p>Using the fault PIDs recorded, GO to the appropriate pinpoint test step.</p> <p>For 2909_31_OD (Front Passenger Side Belt Tension Sensor Circuit Fault) ( LFC 7-13), GO to <u>W2</u> .</p> <p>For 2909_29_OD (Front Passenger Side Belt Tension Sensor Short to Ground) ( LFC 7-14), GO to <u>W4</u> .</p> <p><b>No</b> This is an intermittent fault when present as a CMDTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to <u>W9</u> .</p>
<b>W2 CHECK THE BTS CIRCUITS FOR A SHORT TO VOLTAGE</b>	

<ul style="list-style-type: none"><li>• Ignition OFF.</li><li>• Depower the SRS . GO to <u>W10</u> .</p> <p><b>No</b> GO to <u>W3</u> .</p>						
<p><b>W3 CHECK THE BTS CIRCUITS FOR AN OPEN</b></p>							
<ul style="list-style-type: none"><li>• Ignition OFF.</li><li>• Depower the SRS . Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li><li>• Measure the resistance between OCSM 3043, harness side and passenger safety belt buckle switch and BTS 3066, harness side using the following chart:</li></ul> <table><tr><th>OCSM</th><th>Circuit</th><th>Passenger Safety Belt Buckle Switch And BTS</th></tr><tr><td>C3043-11</td><td>2088 (TN/RD)</td><td>C3066-4</td></tr></table>	OCSM	Circuit	Passenger Safety Belt Buckle Switch And BTS	C3043-11	2088 (TN/RD)	C3066-4	<p><b>Yes</b> GO to <u>W5</u> .</p> <p><b>No</b> REPAIR circuit 2088 (TN/RD), 2089 (OG/BK) or 2090 (DB/OG). GO to <u>W10</u> .</p>
OCSM	Circuit	Passenger Safety Belt Buckle Switch And BTS					
C3043-11	2088 (TN/RD)	C3066-4					

C3043-13	2090 (DB/OG)	C3066-5
C3043-12	2089 (OG/BK)	C3066-6

N0083332

- Are the resistances less than 0.5 ohm?

**W4 CHECK CIRCUITS 2088 (TN/RD), 2089 (OG/BK) AND 2090 (DB/OG) FOR A SHORT TO GROUND**

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Disconnect: Passenger Safety Belt Buckle and BTS C3066.
- Disconnect: OCSM C3043.
- Measure the resistance between OCSM :
  - ◆ C3043-11, circuit 2088 (TN/RD), harness side and ground.
  - ◆ C3043-12, circuit 2089 (OG/BK) harness side and ground
  - ◆ C3043-13, circuit 2090 (DB/OG), harness side and ground.

N0003717

- Are the resistances greater than 10,000 ohms?

**W5 CHECK FOR A SHORT BETWEEN CIRCUITS 2088 (TN/RD), 2089 (OG/BK) AND 2090 (DB/OG)**

- Measure the resistance between OCSM :
  - ◆ C3043-11, circuit 2088 (TN/RD), harness side and C3043-12, circuit 2089 (OG/BK), harness side.

**Yes**

GO to W5 .

**No**

REPAIR circuit 2088 (TN/RD), 2089 (OG/BK) or 2090 (DB/OG). GO to W10 .

**Yes**

GO to W6 .

**No**

REPAIR circuit 2088 (TN/RD), 2090 (DB/OG) and/or 2089 (OG/BK). GO to W10 .

- ◆ C3043-11, circuit 2088 (TN/RD), harness side and C3043-13, circuit 2090 (DB/OG), harness side.
- ◆ C3043-12, circuit 2089 (OG/BK), harness side and C3043-13, circuit 2090 (DB/OG), harness side.

N0083334

- Are the resistances greater than 10,000 ohms?

**W6 CHECK THE OCSM OUTPUT**

- Connect: OCSM C3043 .
- Disconnect: Passenger Seat Side Air Bag Module C316.
- Connect: Restraint System Diagnostic Tool 418-133 to Passenger Seat Side Air Bag Module C316.
- Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Measure the voltage between BTS C3066-4, circuit 2088 (TN/RD), harness side and C3066-5, circuit 2090 (DB/OG), harness side.

N0072465

- Is voltage approximately 5 volts?

**Yes**GO to W7 .**No**INSTALL a new OCS system service kit. REFER to Occupant Classification Sensor in this section.GO to W10 .**W7 CHECK BTS VOLTAGE OUTPUT**

- Ignition OFF.
- Connect a fused jumper lead between passenger safety belt buckle switch and BTS C3066 pin 4, circuit 2088 (TN/RD), harness side and pin 4, circuit 2088

**Yes**GO to W8 .**No**INSTALL a new BTS . REFER to Section 501-20A . GO to W10 .

(TN/RD), component side.

- Connect a fused jumper lead between passenger safety belt buckle switch and BTS C3066 pin 5, circuit 2090 (DB/OG), harness side and pin 5, circuit 2090 (DB/OG), component side.
- Ignition ON.
- Measure the voltage between passenger safety belt buckle switch and BTS C3066 pin 4, circuit 2088 (TN/RD), harness side and pin 4, circuit 2088 (TN/RD), component side. and ground as you vary the tension of the BTS .

N0096114

- Measure the voltage between passenger safety belt buckle switch and BTS C3066 pin 5, circuit 2090 (DB/OG), harness side and pin 5, circuit 2090 (DB/OG), component side and ground as you vary the tension of the BTS .

N0096115

- **Does the voltage vary from approximately 0.95 volt with no tension applied to the sensor to approximately 3.8 volts with full tension applied to the sensor?**

#### W8 CONFIRM THE BTS FAULT

**NOTE:** Make sure all restraint system diagnostic tools, sensor electrical connectors, OCSM and the RCM electrical connectors are connected before carrying out the self test. If not, DTCs will be recorded.

- Ignition OFF.

#### Yes

INSTALL a new OCS system service kit. REFER to Occupant Classification Sensor in this section. GO to W10 .

#### No

CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness.

<ul style="list-style-type: none"> <li>• Depower the SRS . ### Pinpoint Test X: DTC C1414

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Codes (LFCs) indicates the specific fault PIDs associated with DTC C1414:

LFC	Description
1-5	Restraints Control Module (RCM) Version Conflicts with Occupant Classification System (OCS) Version
Flashing (5Hz)	RCM in Plant Mode
11-3	RCM Version Conflicts with Passenger First Row Impact Sensor Version
11-2	RCM Version Conflicts with Driver First Row Impact Sensor Version
11-1	RCM Version Conflicts with Front Driver Impact Severity Sensor Version
12-1	RCM Version Conflicts with Front Passenger Impact Severity Sensor Version

#### Normal Operation

The Restraints Control Module (RCM) monitors the communication condition and circuits of the impact sensors and the Occupant Classification System (OCS) system for an embedded vehicle identification.

If the RCM receives conflicting information from the impact sensors or OCS system it will store DTC C1414 in memory and, depending on the fault, flash a LFC on the air bag warning indicator. The secondary air bag warning chime will also be activated.

Fault PIDs <sup>a</sup>	Description	Fault Trigger Condition
-------------------------	-------------	-------------------------

1414_25_OD and 1414_25_CM	Row 1 Passenger Side Crash Sensor Mismatch	When the Restraints Control Module (RCM) senses incorrect sensor or sensor identification, a fault will be indicated.
1414_27_OD and 1414_27_CM	Row 1 Driver Side Crash Sensor Mismatch	When the RCM senses incorrect sensor or sensor identification, a fault will be indicated.
1414_28_OD and 1414_28_CM	Driver-Center Front Crash Sensor Mismatch	When the RCM senses incorrect sensor or sensor identification, a fault will be indicated.
1414_31_OD and 1414_31_CM	Occupant Classification Sensor CAN ID Mismatch	When the RCM receives incorrect identification from the Occupant Classification System Module (OCSM), a fault will be indicated.

<sup>a</sup> Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC C1414. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC C1414.

**This pinpoint test is intended to diagnose the following:**

- Incorrect RCM for vehicle
- Incorrect impact sensor information
- Incorrect OCS system for vehicle
- Wiring, terminals or connectors

**PINPOINT TEST X: DTC C1414**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>X1 RETRIEVE SRS DTCs</b>

GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.  <b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.

### Pinpoint Test Y: DTC C1946

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC C1946:

- LFC 4-9 - Front Driver's Seat Track Position Switch Circuit Open

#### Normal Operation

The seat track position sensor informs the Restraints Control Module (RCM) of the driver seat position.

The RCM monitors the driver seat track position sensor circuits. If the RCM detects an open circuit fault, it will store DTC C1946 in memory, flash a LFC on the air bag warning indicator.

- DTC C1946 (Driver Seat Track Position Sensor Circuit Open) - If the RCM detects an open on the driver seat track position sensor circuit, it will set this DTC.

#### **This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

**PINPOINT TEST Y: DTC C1946**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

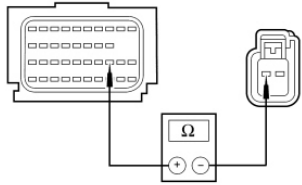

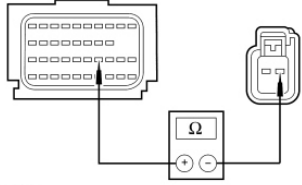

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

### Pinpoint Test Z: DTC C1947

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC C1947:

- LFC 7-3 - Front Driver's Seat Track Position Switch Circuit Short to Ground

#### Normal Operation

The seat track position sensor informs the Restraints Control Module (RCM) of the driver seat position.

The RCM monitors the driver seat track position sensor circuits. If the RCM detects a short to ground, it will store DTC C1947 in memory, flash LFC 7-3 on the air bag warning indicator.

- DTC C1947 (Front Driver's Seat Track Position Switch Circuit Short to Ground) - If the RCM detects a short to ground on the driver seat track position sensor circuit, it will set this DTC.

#### **This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

#### PINPOINT TEST Z: DTC C1947

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

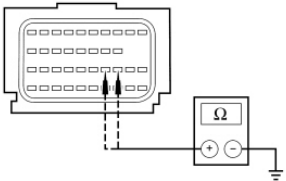

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>Z1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC C1947 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. RETURN the vehicle to the customer.
--	---

### Pinpoint Test AA: DTC C1948

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

#### Lamp Fault Codes (LFCs)

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC C1948:

- LFC 7-7 - Front Driver's Seat Track Position Switch Circuit Resistance Out of Range

#### Normal Operation

The seat track position sensor informs the Restraints Control Module (RCM) of the driver seat position.

The RCM monitors the driver seat track position sensor circuits. If the RCM detects a current out of range condition, it will store DTC C1948 in memory, flash a LFC 7-7 on the air bag warning indicator.

- DTC C1948 (Front Driver's Seat Track Position Switch Circuit Resistance Out of Range) - If the RCM detects a current out of range between forward and rearward on the driver seat track position switch, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Driver seat track position sensor
- RCM

#### PINPOINT TEST AA: DTC C1948

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>AA1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC C1948 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test. GO to <a href="#">AA2</a> .</p> <p><b>No</b> This is an intermittent fault when present as a CMDTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to <a href="#">AA3</a> .</p>
<b>AA2 CHECK THE SEAT TRACK POSITION SENSOR</b>	
<ul style="list-style-type: none"> <li>Ignition OFF.</li> <li>Depower the SRS . Refer to <u>Seat Position Sensor</u> in this section.</li> <li>Repower the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>Ignition ON.</li> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC C1948 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> INSTALL a new RCM . REFER to <u>Restraints Control Module (RCM)</u> in this section. GO to <a href="#">AA4</a> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. <b>Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.</b> REPAIR any intermittent wiring, terminals or connector concerns found. GO to <a href="#">AA4</a> .</p>
<b>AA3 CHECK FOR AN INTERMITTENT FAULT</b>	
<ul style="list-style-type: none"> <li>Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li><b>Was DTC C1948 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test. GO to <a href="#">AA2</a> .</p> <p><b>No</b> CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other</p>

	systems in the same wire harness. <b>Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.</b> REPAIR any intermittent wiring, terminals or connector concerns found. GO to <u>AA4</u> .
<b>AA4 CHECK FOR ADDITIONAL SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>•  <b>WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.</b></li> <li>• Reconnect all SRS components (if previously disconnected).</li> <li>• If previously directed to depower the SRS , repower the SRS . <b>Do not</b> prove out the SRS at this time. Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Are any DTCs retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> Do not clear any DTCs until all DTCs have been resolved. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b> CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

**Pinpoint Test AB: DTC C1982**

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

**Lamp Fault Codes (LFCs)**

The following Lamp Fault Code (LFC) indicates the specific fault associated with DTC C1982:

- LFC 7-11 - Front Driver's Seat Track Position Switch Circuit Short to Battery

**Normal Operation**

The seat track position sensor informs the Restraints Control Module (RCM) of the driver seat position.

The RCM monitors the driver seat track position sensor circuits. If the RCM detects a short to voltage, it will store DTC C1982 in memory, flash LFC 7-11 on the air bag warning indicator.

- DTC C1982 (Front Driver's Seat Track Position Switch Circuit Short to Battery) - If the RCM detects a short to battery on the driver seat track position sensor circuit, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- Seat track position sensor
- RCM

**PINPOINT TEST AB: DTC C1982**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

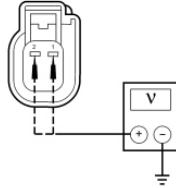

**NOTICE:** Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**NOTE:** SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the Pinpoint Test.

Test Step	Result / Action to Take
<b>AB1 RETRIEVE SRS DTCs</b>	
<ul style="list-style-type: none"> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Was DTC C1982 retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b> The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self test. GO to <u>AB2</u> .</p> <p><b>No</b> This is an intermittent fault when present as a CMDTC only (DTC not retrieved on demand). The fault condition is not present at this time. GO to <u>AB4</u> .</p>
<b>AB2 CHECK CIRCUITS 1520 (LG) AND 1558 (TN/BK) FOR A SHORT TO VOLTAGE</b>

Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - RCM .</li> <li>• <b>Are any DTCs retrieved on-demand during self-test?</b></li> </ul>	<p><b>Yes</b></p> <p>Do not clear any DTCs until all DTCs have been resolved. GO to the Supplemental Restraint System (SRS) DTC Chart in this section for pinpoint test direction.</p> <p><b>No</b></p> <p>CLEAR all CMDTCs . PROVE OUT the SRS . REPAIR is complete. RETURN the vehicle to the customer.</p>

### Pinpoint Test AC: DTC B1317/B1318

Refer to Wiring Diagrams Cell **46** , Supplemental Restraint System for schematic and connector information.

**NOTE:** DTCs B1317, B1318 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

### Normal Operation - Restraints Control Module (RCM)

The Restraints Control Module (RCM) continuously monitors the input voltage for correct operation. If the RCM detects input voltage below 9 volts, it will store DTC B1318 in memory. If the RCM detects input voltage of 20 volts, it will store DTC B1317 in memory. If the RCM sets DTC B1317 or B1318, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

- DTC B1317 (Battery Voltage High) - If the RCM detects voltage above 17.5 volts, it will set this DTC.

- DTC B1318 (Battery Voltage Low) - If the RCM detects voltage below 9 volts, it will set this DTC.

**This pinpoint test is intended to diagnose the following:**

- Wiring, terminals or connectors
- RCM
- Occupant Classification System Module (OCSM)

#### PINPOINT TEST AC: DTC B1317/B1318

**⚠ WARNING:** Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

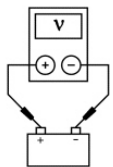

**NOTICE:** Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

**NOTE:** Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

**NOTE:** Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

**NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
<b>AC1 RETRIEVE ALL CMDTCs IN ALL MODULES</b>	
<ul style="list-style-type: none"> <li>• Ignition ON.</li> <li>• Enter the following diagnostic mode on the scan tool: Self Test - ALL CMDTC .</li> <li>• <b>Is DTC B1317, B1318 or B1676 present in one or more modules AND P0563, P0620, P0625, P0626 or P065B retrieved from the PCM?</b></li> </ul>	<p><b>Yes</b> REFER to <a href="#">Section 414-00</a> to diagnose the charging system.</p> <p><b>No</b> GO to <a href="#">AC2</a> .</p>
<b>AC2 TEST BATTERY CONDITION</b>	
<p><b>NOTE:</b> DTCs B1317, B1318 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.</p> <ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Carry out the battery condition test. CLEAR all CMDTCs . TEST the system for normal operation.</p> <p>If the battery passed the condition test and did not require a recharge, GO to <a href="#">AC3</a> .</p> <p><b>No</b> INSTALL a new battery. CLEAR all CMDTCs . TEST the</p>

	SRS for normal operation.
<b>AC3 CHECK CHARGING SYSTEM VOLTAGE</b>	
<p><b>NOTE:</b> Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step.</p> <ul style="list-style-type: none"> <li>• Measure the voltage of the battery: <ul style="list-style-type: none"> <li>♦ For DTC B1317, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.</li> <li>♦ For DTC B1318, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.</li> </ul> </li> </ul>  <p style="text-align: center;">AJ0210-A</p> <ul style="list-style-type: none"> <li>• Is voltage between 13 and 15.2 volts?</li> </ul>	<p><b>Yes</b> For DTC B1318, GO to <a href="#">AC4</a> .  For DTC B1317, GO to <a href="#">AC6</a> .</p> <p><b>No</b> REFER to <a href="#">Section 414-00</a> to diagnose the charging system. CLEAR all CMDTCs . TEST the SRS for normal operation.</p>
<b>AC4 CHECK FOR OPEN IGNITION CIRCUIT TO THE MODULE</b>	
<ul style="list-style-type: none"> <li>• Ignition OFF.</li> <li>• Depower the SRS . Refer to <a href="#">Supplemental Restraint System (SRS) Depowering and Repowering</a> in this section.</li> <li>• Disconnect: RCM C310a and C310b.</li> <li>• Measure the resistance between RCM C310a-12, circuit 937 (RD/WH), harness side, and Central Junction Box (CJB) fuse 2 (10A).</li> <li>• Is the resistance less than 1 ohm?</li> </ul>	<p><b>Yes</b> GO to <a href="#">AC5</a> .</p> <p><b>No</b> REPAIR the circuit as necessary. CLEAR all CMDTCs . TEST the SRS for normal operation.</p>
<b>AC5 CHECK FOR OPEN GROUND TO THE MODULE</b>	
<ul style="list-style-type: none"> <li>• Measure the resistance between the RCM C310a-16, circuit 676 (PK/OG) and a good ground.</li> <li>• Is the resistance less than 5 ohms?</li> </ul>	<p><b>Yes</b> GO to <a href="#">AC6</a> .</p> <p><b>No</b> REPAIR circuit 676 (PK/OG) as necessary.</p> <p>CLEAR all CMDTCs . TEST the SRS for normal operation.</p>
<b>AC6 CHECK FOR MODULE OPERATION</b>	
<ul style="list-style-type: none"> <li>• Depower the SRS . Refer to <a href="#">Supplemental Restraint System (SRS) Depowering and Repowering</a> in this section.</li> <li>• Disconnect: RCM C310a and C310b.</li> </ul>	<p><b>Yes</b> INSTALL a new RCM . REFER to <a href="#">Restraints Control Module (RCM)</a> in this section.</p>

<ul style="list-style-type: none"> <li>• Check for the following:                             <ul style="list-style-type: none"> <li>◆ corrosion.</li> <li>◆ damaged pins.</li> <li>◆ pushed-out pins.</li> </ul> </li> <li>• Connect the RCM C310a and C310b and make sure the connector seats correctly.</li> <li>• Repower the SRS . Refer to <u>Supplemental Restraint System (SRS) Depowering and Repowering</u> in this section.</li> <li>• Operate the system and verify the concern is still present.</li> <li>• <b>Is the concern still present?</b></li> </ul>	<p><b>No</b></p> <p>The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all CMDTCs . TEST the SRS for normal operation.</p>
--	--

---

---

**Supplemental Restraint System (SRS) Depowering and Repowering**

Special Tool(s)

	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
---	---

**Depowering Procedure**

**⚠ WARNING:** Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING:** To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF.
2. Turn the ignition to OFF.
3. At the Central Junction Box (CJB), located on the LH end of the instrument panel, open the kick panel cover and remove the RCM fuse 22 (10A) from the CJB . For additional information, refer to the Wiring Diagram Manual.
4. Turn the ignition ON and monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.
5. Turn the ignition OFF.
6. **⚠ WARNING:** Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

**Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s).**

**To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).**

**Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.**

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

### Repowering Procedure

1. **⚠ WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.**

Make sure all restraint system diagnostic tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

2. Turn the ignition from OFF to ON.
3. Install the RCM fuse 22 (10A) to the CJB and close the cover.
4. **⚠ WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

Connect the battery ground cable. For additional information, refer to Section 414-01 .

5. Prove out the SRS as follows:

Turn the ignition from ON to OFF. Wait 10 seconds, then turn the ignition back to ON and monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will:

- fail to light.
- remain lit continuously.
- flash.

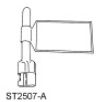

The flashing might not occur until approximately 30 seconds after the ignition has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous DTCs from the RCM using a scan tool.

**Supplemental Restraint System (SRS) Deactivation and Reactivation**

## Special Tool(s)

	Diagnostic Tool, Restraint System (2 required) 418-133
	Diagnostic Tool, Restraint System (4 required) 418-F395
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

**Deactivation**

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING:** To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF.
2. Turn the ignition to OFF.
3. At the Central Junction Box (CJB), located below the LH side of the instrument panel, remove the cover and the RCM fuse 22 (10A) from the CJB . For additional information, refer to the Wiring Diagram Manual.
4. Turn the ignition ON and monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. **⚠ WARNING:** Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.

Refer to the Description and Operation portion of **Section 501-20B** for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

**Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.**

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to **Section 414-01**.

7. **NOTE:** A tool that has a blunt end, such as a 4.0 mm (0.15 in) Allen wrench, is better able to disengage the steering wheel spring clip from the driver air bag module locking pins.

Using a 4 mm (0.15 in) Allen wrench or suitable tool, place 2 marks on the tool as an aid to remove the driver air bag module. One mark should be approximately 35 mm (1.37 in) from the end of the tool with the second mark approximately 45 mm (1.77 in) from the end of the tool.

8. **NOTE:** The steering wheel rear cover has internal guides that assist in directing the tool to the correct location. Allow the steering wheel rear cover to guide the tool, minimal force is needed.

**Gently** insert the tool into a steering wheel rear cover upper access hole until the end of the tool comes into contact with an obstruction. The 45 mm (1.77 in) mark on the tool should be even or close to even with the steering wheel rear cover. If the 45 mm (1.77 in) mark on the tool is not even or close to even with the steering wheel rear cover, remove the tool from the steering wheel and carry out the step once again to correctly position the tool.

- If the 45 mm (1.77 in) mark on the tool goes into the steering wheel rear cover, the tool was directed past the steering wheel spring clip. Use a tool of a slightly larger diameter or, using the internal guides of the steering wheel rear cover, insert the tool to the 45 mm (1.77 in) mark and proceed to the next step.

9. **NOTE:** The steering wheel is removed for clarity. The upper corner of the steering wheel rear cover is cut away to show the internal guides and the steering wheel spring clip.

With the tool correctly positioned, remove the tool approximately 2-3 mm (0.07-0.11 in) from the access hole then gently push the tool forward (toward front of vehicle). This puts the tool in the best position to disengage the steering wheel spring clip from the driver air bag module locking pin.

10. **NOTE:** Make sure to disengage the steering wheel spring clip from the driver air bag module locking pin before gently pulling the corresponding corner of the driver air bag module. No or very little force is needed to separate the corresponding corner of the driver air bag module from the steering wheel once the spring clip is disengaged from the locking pin.

**NOTE:** When the steering wheel spring clip is disengaged from the first locking pin, the corresponding corner of the driver air bag module will only separate 2-4 mm (0.07-0.15 in) from the steering wheel. The driver air bag module will separate more noticeably as subsequent locking pins are disengaged.

Push the tool deeper into the access hole (approximately 4-8 mm [0.15-0.31 in]) with enough force to disengage the steering wheel spring clip from the driver air bag module locking pin. The corresponding corner of the driver air bag module should pop up once the spring clip is disengaged from the locking pin. **Gently** pull the corresponding corner of the driver air bag module to make sure the locking pin does not reengage the spring clip. Remove the tool from the access hole. Discontinue pulling on the corresponding corner of the driver air bag module.

- If the corresponding corner of the driver air bag module does not easily separate from the steering wheel, the spring clip is not disengaged from the locking pin. Repeat the necessary steps to correctly position the tool and disengage the spring clip from the locking pin.

11. **NOTE:** The steering wheel rear cover has internal guides that assist in directing the tool to the correct location. Allow the steering wheel rear cover to guide the tool, minimal force is needed.

Working on the same side of the steering wheel, **gently** insert the tool into a steering wheel rear cover lower access hole until the end of the tool comes into contact with an obstruction. The 35 mm (1.37 in) mark on the tool should be even or close to even with the steering wheel cover. If the 35 mm (1.37 in) mark on the tool is not even or close to even with the steering wheel cover, remove the tool from the access hole and carry out the step once again to correctly position the tool.

- If the 35 mm (1.37 in) mark on the tool goes into the steering wheel rear cover, the tool was directed past the steering wheel spring clip. Use a tool of a slightly larger diameter or, using the internal guides of the steering wheel rear cover, insert the tool to the 35 mm (1.37 in) mark and proceed to the next step.

12. **NOTE:** The steering wheel is removed for clarity. The lower corner of the steering wheel rear cover is cut away to show the internal guides and the steering wheel spring clip.

With the tool correctly positioned, remove the tool approximately 2-3 mm (0.07-0.11 in) from the access hole then gently push the tool forward (toward front of vehicle). This puts the tool in the best position to disengage the steering wheel spring clip from the driver air bag module locking pin.

13. **NOTE:** Make sure to disengage the steering wheel spring clip from the driver air bag module locking pin before gently pulling the corresponding corner of the driver air bag module. No or very little force is needed to separate the corresponding corner of the driver air bag module from the steering wheel once the spring clip is disengaged from the locking pin.

Push the tool deeper into the access hole (approximately 3-6 mm [0.11-0.23 in]) with enough force to disengage the steering wheel spring clip from the driver air bag module locking pin. The corresponding corner of the driver air bag module should pop up once the spring clip is disengaged from the locking pin. **Gently** pull the corresponding corner of the driver air bag module to make sure the locking pin does not reengage the spring clip. Remove the tool from the access hole. Discontinue pulling on the corresponding corner of the driver air bag module.

- If the corresponding corner of the driver air bag module does not easily separate from the steering wheel the spring clip is not disengaged from the locking pin. Repeat the necessary steps to correctly position the tool and disengage the spring clip from the locking pin.

14. **NOTE:** Disengage the steering wheel spring clips from the 2 locking pins on one side of the driver air bag module before proceeding to the other side.

Repeat the above steps to disengage the 2 remaining driver air bag module locking pins.

15. **NOTE:** The driver air bag electrical connectors cannot be reversed at installation. Note the electrical connectors position for installation.

Disconnect and remove the driver air bag module.

1. Release the driver air bag module electrical wiring from the driver air bag wiring clip.
2. Squeeze the tabs and disconnect the driver air bag module electrical connector.
3. Squeeze the tabs and disconnect the driver air bag module electrical connector.
4. Disconnect the horn electrical connector.
5. Remove the driver air bag module.

16. Attach a Restraint System Diagnostic Tool to each of the clockspring electrical connectors at the top of the steering column.

17. Separate the RH instrument panel trim panel.

- Pull out to release the retaining clips.
- Slide the RH instrument panel trim panel slightly to the right, aligning the keyway.
- Pull out, separating the RH instrument panel trim panel.

18. Remove the trim panel.

1. Disconnect the rear window defrost switch electrical connector.
2. If equipped, disconnect the clock electrical connector.
3. Disconnect the Passenger Air Bag Deactivation (PAD) indicator.
4. Remove the RH instrument panel trim panel.

19. Disconnect the glove compartment isolator.

20. While pushing in on the 2 glove compartment door tabs, position the glove compartment downward.

21. Looking up into the front center of the glove compartment opening, separate the passenger air bag module electrical connector and pin-type retainer from the bracket. Disconnect the passenger air bag module electrical connector.

22. Through the glove compartment opening, remove the 2 passenger air bag module bolts.

23. **NOTICE:** Do not handle the passenger air bag module by grabbing the edges of the deployment doors. Damage to the air bag module may occur.

Remove the passenger air bag module.

1. Remove the 2 passenger air bag module bolts.
2. Placing one hand in the glove compartment opening, push the passenger air bag module out and remove it.

**24. NOTICE: Care must be taken to prevent damage to the passenger air bag module electrical connectors and locking inserts.**

Gently pry each side of the passenger air bag module jumper harness electrical connector locking insert, working alternately side to side, until the locking insert separates from the electrical connector.

- Repeat to separate the locking insert from the remaining passenger air bag module jumper harness electrical connector.

**25. NOTICE: Care must be taken to prevent damage to the passenger air bag module electrical connectors.**

Using suitable tools (such as small screwdrivers), carefully depress the 2 locking tabs on the side of the passenger air bag module jumper harness electrical connector and disconnect the electrical connector.

- Repeat to disconnect the remaining passenger air bag module jumper harness electrical connector and remove the passenger air bag module jumper harness from the passenger air bag module.

**26. NOTICE: Carefully align the locking inserts to the electrical connectors or damage may result.**

Attach a Restraint System Diagnostic Tool to each of the 2 passenger air bag module jumper harness electrical connectors and align and install the locking inserts to the electrical connectors.

27. Connect the passenger air bag module jumper harness to the passenger air bag module electrical connector on the vehicle wiring harness.

28. Disconnect the passenger seat side air bag module electrical connector, located at the lower rear of the seat cushion pan.

29. Attach the Restraint System Diagnostic Tool to the seat harness side of the passenger seat side air bag module electrical connector.

30. Disconnect the driver seat side air bag module electrical connector, located at the lower rear of the seat cushion pan.

31. Attach the Restraint System Diagnostic Tool to the seat harness side of the driver seat side air bag module electrical connector.

32. Install the RCM fuse 22 (10A) to the CJB .

33. Connect the battery ground cable. For additional information, refer to [Section 414-01](#) .

## Reactivation

1. Remove the RCM fuse 22 (10A) from the CJB .

2. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#) .

3. Remove the Restraint System Diagnostic Tool from the driver seat side air bag electrical connector.

4. Connect the driver seat side air bag module electrical connector, located at the lower rear of the seat cushion pan.

5. Remove the Restraint System Diagnostic Tool from the passenger seat side air bag electrical connector.

6. Connect the passenger seat side air bag module electrical connector, located at the lower rear of the seat cushion pan.

7. Disconnect the passenger air bag module jumper harness from the passenger air bag module electrical connector on the vehicle wiring harness.

8. Separate the locking inserts and remove the Restraint System Diagnostic Tool from each of the passenger air bag module jumper harness electrical connectors.

9. **NOTICE:** The passenger air bag module jumper harness electrical connectors are unique and cannot be reversed when connected to the passenger air bag module. Match the electrical connector key to the keyway in the passenger air bag module. Do not force the electrical connectors into the passenger air bag module. Failure to follow this instruction may result in component damage or system failure.

**NOTICE:** Care must be taken when connecting the passenger air bag module electrical connectors to prevent damage to the electrical connector terminals and the passenger air bag module pins.

**NOTICE:** Carefully align the locking inserts to the electrical connectors or damage may result.

Align and connect the passenger air bag module jumper harness electrical connectors to the passenger air bag module and install the locking inserts.

10. Make sure the J-nuts on the passenger air bag module are fully seated into the slots.

11. **NOTICE: Do not handle the passenger air bag module by grabbing the edges of the deployment doors. Damage to the air bag module may occur.**

Install the passenger air bag module into the instrument panel.

1. Position the passenger air bag module into the instrument panel.
2. Install the 2 bolts.
  - ◆ Tighten to 3 Nm (27 lb-in).

12. Through the glove compartment opening, install the 2 passenger air bag module bolts.
- Tighten to 9 Nm (80 lb-in).

13. Connect the passenger air bag module electrical connector and attach the pin-type retainer to the bracket.

14. Install the RH instrument panel trim panel.
1. Connect the rear window defrost switch electrical connector.
  2. If equipped, connect the clock electrical connector.
  3. Connect the PAD indicator.
  4. Align the retaining clips, slide the trim panel to the left and push in, seating the retaining clips.

15. Connect the glove compartment isolator.

16. Remove the Restraint System Diagnostic Tool from each of the clockspring electrical connectors at the top of the steering column.

17. Connect the driver air bag module.

1. Connect the horn electrical connector.
2. **NOTICE:** The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

Connect the driver air bag module electrical connectors as noted during removal.

3. Install the driver air bag module electrical wiring into the driver air bag wiring clip.

18. **NOTE:** With the driver air bag module held as close to the steering wheel as possible, take up the slack in the wiring by gently tucking any excess length into the pocket at the bottom of the steering wheel before rocking the driver air bag module into place.

Align the 4 driver air bag module locking pins to the openings in the steering wheel and position the driver air bag module in place.

19. With the locking pins aligned and the driver air bag module positioned to the steering wheel, push inward, seating the 4 locking pins to the spring clips.
  - An audible click should be heard when the driver air bag module locking pins are seated in place to the spring clip. When the 4 locking pins are seated in place, there should be an even uniform gap between the driver air bag module trim cover and the steering wheel.

20. **⚠ WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.**

Make sure all Restraint System Diagnostic Tool(s) that may have been installed during the repair have been removed from the vehicle and all SRS components are connected.

21. Turn the ignition from OFF to ON.
22. Install the RCM fuse 22 (10A) to the CJB and install the cover.
23. **⚠ WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

Connect the battery ground cable. For additional information, refer to [Section 414-01](#) .

24. Prove out the SRS as follows:

Turn the ignition from ON to OFF. Wait 10 seconds, then turn the ignition back to ON and monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will:

- fail to light.
- remain lit continuously.
- flash.

The flashing might not occur until approximately 30 seconds after the ignition has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous DTCs from the RCM using a scan tool.

---

**Inspection and Repair After a Supplemental Restraint System (SRS) Deployment**

**⚠ WARNING:** Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.

**NOTE:** After diagnosing or repairing a Supplemental Restraint System (SRS), the restraint system diagnostic tools (if required) must be removed before operating the vehicle over the road.

**NOTE:** Deployable devices (such as air bag modules, pretensioners) may deploy alone or in various combinations depending on the impact event.

**NOTE:** Always refer to the appropriate workshop manual procedures prior to carrying out vehicle repairs affecting the SRS and safety belt system.

**NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

**All vehicles**

1. **NOTE:** Refer to the correct removal and installation procedure for all SRS components being installed.

When any deployable device or combination of devices have deployed and/or the Restraints Control Module (RCM) has DTC B1231/B1193:00 (Event Threshold Exceeded) in memory, the repair of the vehicle SRS is to include the removal of all deployed devices and the installation of new deployable devices, the removal and installation of new impact sensors and the removal and installation of a new RCM. DTCs must be cleared from all required modules after repairs are carried out.

**Vehicles with Occupant Classification System (OCS) system**

2. **NOTE:** After installation of new Occupant Classification System (OCS) components, carry out the Occupant Classification System (OCS) System Reset procedure as instructed in the workshop manual. Refer to the appropriate workshop manual for OCS system removal and installation procedure.

When a vehicle has been involved in a collision and the Occupant Classification System Module (OCSM) has DTC B1231/B1193:00 stored in memory, the repair of the OCS system is to include the following procedures for the specified system:

- For rail-type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install new OCS system rails. Do not install a new OCSM unless DTC B1231 cannot be cleared.
- For weight sensor bolt-type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install a new seat track with OCS system weight sensor bolts. DTC must be cleared from the OCSM before carrying out Occupant Classification System (OCS) System Reset. Do not install a new OCSM unless DTC B1231/B1193:00 cannot be cleared.
- For bladder-type OCS system, inspect for damage and repair as necessary. If installation of an OCS system component is required, an OCS system service kit must be installed.

**All vehicles**

3. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.
  4. When the driver air bag module has deployed, a new clockspring must be installed.
  5. New driver and/or front passenger safety belt systems (including retractors, buckles and height adjusters) must be installed if the vehicle is involved in a collision that results in deployment of the driver and/or front passenger safety belt pretensioners. For additional information, refer to Section 501-20A .
  6. Inspect the entire vehicle for damage, including the following components:
    - Steering column (deployable column if equipped)
    - Instrument panel knee bolsters and mounting points
    - Instrument panel braces and brackets
    - Instrument panel and mounting points
    - Seats and seat mounting points
    - Safety belts, safety belt buckles and safety belt retractors. For additional information, refer to Section 501-20A .
    - SRS wiring, wiring harnesses and connectors
  7. After carrying out the review and inspection of the entire vehicle for damage, repair or install new components as needed.
-

---

## Pyrotechnic Device Disposal

### Disposal of Deployable Devices and Pyrotechnic Devices That are Undeployed/Inoperative

**NOTE:** All inoperative air bag modules and safety belt pretensioners have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned.

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
2. Remove the undeployed/inoperative device. For additional information, refer to the appropriate procedure in this section or Section 501-20A .
3. **NOTE:** When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the Vehicle Identification Number (VIN) must be recorded and sent to Ford Motor Company.

If installing a new air bag module, record the necessary information and return the inoperative air bag module to Ford Motor Company.

### Disposal of Deployable Devices and Pyrotechnic Devices That Are Deployed

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
2. Remove the deployed device. For additional information, refer to the appropriate procedure in this section or Section 501-20A .
3. **NOTE:** If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to the Description and Operation portion of this section.

Dispose of the deployed device in the same manner as any other part to be scrapped.

### Disposal of Deployable Devices and Pyrotechnic Devices That Require Manual Deployment

1. Safety and environmental concerns require consideration and treatment of restraints system deployable and pyrotechnic devices when disposing of vehicles, deployable devices or pyrotechnic devices. Deploying deployable and pyrotechnic devices before scrapping a vehicle or the device eliminates the potential for hazardous exposures or reactions during processing. If special handling procedures are followed, deployable and pyrotechnic devices can be deployed safely and recycled with the vehicle, shipped separately to a recycling facility or disposed of safely.

**NOTE:** To determine the deployable devices a vehicle is equipped with, refer to the Description and Operation portion of this section.

A vehicle equipped with any of the following deployable devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

- Driver air bag module
- Passenger air bag module
- Seat side air bag modules
- Safety Canopy® modules
- Side air curtain modules

2. **NOTE:** To determine the pyrotechnic devices a vehicle is equipped with, refer to the Description and Operation portion of this section.

A vehicle equipped with any of the following pyrotechnic devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

- Safety belt buckle pretensioners
- Safety belt retractor pretensioners
- Adaptive load-limiting retractors
- Deployable steering column

3. **NOTE:** To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to the Description and Operation portion of this section.

If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. For additional information, refer to Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules - Remote Deployment in this procedure.

### **Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules - Remote Deployment**

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING:** Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

**⚠ WARNING:** Always carry or place a live Safety Canopy®, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

**⚠ WARNING:** Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is

**required. Failure to follow these instructions may result in serious personal injury.**

**NOTE:** For air bag modules with multiple loops, all the loops on the air bag module must be deployed.

**NOTE:** Some driver and passenger front air bags have 2 deployment stages. After a collision it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

**NOTE:** A typical air bag disposal is shown that is similar for all vehicles.

#### **All driver, passenger and seat side air bag modules**

1. Make a container to house the air bag module for deployment.

- **NOTE:** The tires must be of sufficient size to accommodate the air bag module.

Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.

- With the tire and wheel assembly on the bottom, stack the tires.
- Securely tie all of the tires together.

2. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
3. Remove the air bag module. For additional information, refer to the appropriate procedure in this section.
4. **NOTE:** If the air bag module does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the air bag module.  
  
Cut each of the air bag module wires near the electrical connector that connects to the vehicle wire harness.
5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
6. **NOTE:** Typical driver air bag module with 2 loops shown, other air bag modules with multiple loops similar.

For air bag modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

7. Make a jumper harness to deploy the air bag module.
  - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
  - At one end of the jumper harness, connect the wires together.
8. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the air bag module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

### Driver air bag modules

9. **NOTE:** Make sure to maintain the connections to the air bag module.

With the stack of tires upright and the wheel on the bottom, carefully place the driver air bag module, with the trim cover facing up, on the wheel.

### Passenger and seat side air bag modules

10. **NOTE:** Make sure to maintain the connections to the air bag module.

Tip the stack of tires on its side and place the air bag module inside the center tire, making sure that there are 2 tires beneath the tire containing the air bag module and 2 tires (including the tire and wheel assembly) above the tire containing the air bag module.

11. Place the tire stack upright, with the wheel on top.

### All driver, passenger and seat side air bag modules

12. Remain at least 9.14 m (30 ft) away from the air bag module.
13. From the end of the jumper harness that is not connected to the air bag module, disconnect the 2 wires of the jumper harness from each other.
14. Deploy the air bag module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
15. To allow for cooling, wait at least 10 minutes before approaching the deployed air bag module.
16. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.

### Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Adaptive Load Limiting Safety Belt Retractors - Remote Deployment

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

**⚠ WARNING:** Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

**NOTE:** A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Make a container to house the safety belt buckle or retractor for deployment.
  - **NOTE:** The tires must be of sufficient size to accommodate the safety belt buckle or retractor.
  - Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
  - With the tire and wheel assembly on the bottom, stack the tires.
  - Securely tie all of the tires together.

2. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
3. Remove the safety belt buckle or retractor. For additional information, refer to the appropriate procedure in Section 501-20A .
  - When deploying a safety belt buckle pretensioner, install a nut and bolt of sufficient length and of the same diameter as was used to retain it to the seat.
4. **NOTE:** If the safety belt buckle or retractor does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the safety belt buckle or retractor.  
  
Cut each of the safety belt buckle or retractor wires near the electrical connector that connects to the vehicle wire harness.
5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
6. Make a jumper harness to deploy the safety belt buckle or retractor.
  - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
  - At one end of the jumper harness, connect the wires together.
7. **NOTE:** Typical safety belt retractor pretensioner shown, other safety belt buckle pretensioners and load-limiting retractors similar.

Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

8. **NOTE:** Make sure to maintain the connections to the safety belt buckle or retractor.

Tip the stack of tires on its side and place the safety belt buckle or retractor inside the center tire, making sure that there are 2 tires beneath the tire containing the safety belt buckle or retractor and 2 tires (including the tire and wheel assembly) above the tire containing the safety belt buckle or retractor.

9. Place the tire stack upright, with the wheel on top.

10. Remain at least 9.14 m (30 ft) away from the safety belt buckle or retractor.
11. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.
12. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
13. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.
14. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

#### **Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Load Limiting Safety Belt Retractors - In-Vehicle Deployment**

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

**⚠ WARNING:** Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

**NOTE:** A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Access the safety belt buckle or retractor electrical connectors. For additional information, refer to Section 501-20A.
3. Cut each of the safety belt buckle or retractor wires, leaving at least 101.6 mm (4 in) to work with.
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
5. Make a jumper harness to deploy the safety belt buckle or retractor.
  - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
  - At one end of the jumper harness, connect the wires together.
6. **NOTE:** Typical safety belt retractor pretensioner shown, other safety belt buckle pretensioners and load-limiting retractors are similar.

Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

7. Remain at least 9.14 m (30 ft) away from the safety belt buckle or retractor.
8. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.
11. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

### Safety Canopy® Modules and Side Air Curtain Modules - In-Vehicle Deployment

**⚠ WARNING:** Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

**NOTE:** The Safety Canopy® module deployment for a scrapped vehicle will occur in its installed position in the vehicle.

**NOTE:** A typical Safety Canopy® module disposal is shown that is similar for all vehicles.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
2. Access the Safety Canopy®/side air curtain module electrical connectors. For additional information, refer to the appropriate procedure in this section.
3. Cut each of the Safety Canopy®/side air curtain module wires leaving at least 101.6 mm (4 in) to work with.
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
5. **NOTE:** Typical Safety Canopy®/side air curtain module with 2 loops shown, other Safety Canopy®/side air curtain modules with 2 loops are similar.

For Safety Canopy®/side air curtain modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

6. Make a jumper harness to deploy the Safety Canopy®/side air curtain module.
  - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
  - At one end of the jumper harness, connect the wires together.
7. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the Safety Canopy®/side air curtain module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

8. From the end of the jumper harness that is not connected to the Safety Canopy®/side air curtain module, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the Safety Canopy®/side air curtain module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed Safety Canopy®/side air curtain module.
11. Dispose of the deployed Safety Canopy®/side air curtain module in the same manner as any other part to be scrapped.

## Deployable Steering Column - In-Vehicle Deployment

**⚠ WARNING:** Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
2. **NOTE:** It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering column electrical connector.

Access the deployable steering column electrical connector.

3. **NOTE:** If the deployable steering column does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the deployable steering column.

Cut each of the deployable steering column wires, leaving at least 101.6 mm (4 in) to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
5. Make a jumper harness to deploy the deployable steering column.
  - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
  - At one end of the jumper harness, connect the wires together.
6. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the deployable steering column. Use tape or other insulating material to make sure that the leads do not make contact with each other.

7. Remain at least 9.14 m (30 ft) away from the deployable steering column.
8. From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed steering column.
11. Dispose of the deployed steering column in the same manner as any other part to be scrapped.

SECTION 501-20B: Supplemental Restraint  
System  
REMOVAL AND INSTALLATION

2010 Crown Victoria, Grand Marquis Workshop  
Manual  
Procedure revision date: 08/19/2009

### Front Impact Severity Sensor

Item	Part Number	Description
1	-	Pin-type retainers
2	8C291	Radiator upper shield
3	-	Front impact severity sensor electrical connectors (part of 14290)
4	14B006	Front impact severity sensors
5	W707935	Front impact severity sensor bolts

#### Removal and Installation

**⚠ WARNING:** If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
2. Remove the 3 pin-type retainers and radiator upper shield.

3. Disconnect the electrical connector.
  4. Remove the 2 bolts and front impact severity sensor.
    - To install, tighten to 12 Nm (106 lb-in).
  5. **⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**
- NOTE:** Make sure the radiator core support and front impact severity sensor mating surfaces are clean and free of foreign material.
- To install, reverse the removal procedure.
6. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
-

SECTION 501-20B: Supplemental Restraint  
System  
REMOVAL AND INSTALLATION

2010 Crown Victoria, Grand Marquis Workshop  
Manual  
Procedure revision date: 08/19/2009

## Side Impact Sensor

**NOTE:** RH shown, LH similar.

Item	Part Number	Description
1	13228	Rear door scuff plate
2	25325	Rear door B-pillar weatherstripping
3	14B345	Side impact sensor and bracket
4	W707935	Side impact sensor bolts
5	-	Side impact sensor electrical connector (part of 14A005)
6	20709	Front door B-pillar weatherstripping
7	13208	Front door scuff plate
8	24347	Lower B-pillar trim panel

### Removal

**⚠ WARNING:** If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
2. Remove the front door scuff plate.
3. Remove the rear door scuff plate.
4. Release the front and rear door B-pillar weatherstripping.
5. Pull out to release the retaining clips and remove the lower B-pillar trim panel.
6. **NOTE:** The side impact sensor bolts must be removed in the sequence shown.

Remove the side impact sensor with bracket.

1. Disconnect the electrical connector.
2. Remove the bolt.
3. Remove the bolt.
4. Remove the side impact sensor with bracket.

## Installation

1. **⚠ WARNING:** Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

**NOTE:** The side impact sensor bolts must be installed in the sequence shown.

Install the side impact sensor with bracket.

1. Position the side impact sensor with bracket.
2. Install the bolt.
  - ◆ Tighten to 12 Nm (106 lb-in).
3. Install the bolt.
  - ◆ Tighten to 12 Nm (106 lb-in).
4. Connect the electrical connector.

2. Align the lower B-pillar lower trim panel and push in, seating the retaining clips.

3. Attach the front and rear door B-pillar weatherstripping.
  4. Install the rear door scuff plate.
  5. Install the front door scuff plate.
  6. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
-

**Restraints Control Module (RCM)**

## Special Tool(s)

 ST2834-A	<b>Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)</b> software with appropriate hardware, or equivalent scan tool
---	--

Item	Part Number	Description
1	-	Large Restraints Control Module (RCM) connector (part of 14A005)
2	-	Small RCM connector (part of 14401)
3	14B321	RCM
4	W707935	RCM bolts

**Removal**

**⚠ WARNING:** If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

**⚠ WARNING:** Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

### All vehicles

1. If installing a new RCM , carry out the steps necessary to prepare for Programmable Module Installation (PMI). For additional information, refer to Section 418-01 .

### Vehicles with floor shifter

2. Apply the parking brake and place the transmission in position 1.

### All vehicles

3. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
4. Remove the pin-type retainer and the carpet patch.

### Vehicles with column shifter

5. Remove the ashtray.
  1. Release the tabs.
  2. Remove the ashtray.

6. Position the ashtray bracket aside.
  1. Remove the 2 screws (not shown).
    - ♦ The screws can be accessed from under the instrument panel center stack.
  2. Slide the ashtray bracket forward, releasing the retainers and position the ashtray bracket out of the way to access the RCM .

### Vehicles with floor shifter

7. Release the retaining clips and detach the storage compartment.

8. Disconnect the power point electrical connector and remove the storage compartment.

9. Detach the retaining clips and remove the floor console finish panel.

## All vehicles

10. Remove the 2 RCM bolts on the RH side.
11. Disconnect the large RCM electrical connector.
  1. Pinch the thumb tab and pivot the connector position assurance lever all the way back until it stops.
  2. Pull out and disconnect the RCM electrical connector.

12. Disconnect the small RCM electrical connector.
13. Remove the bolt on the LH side and RCM .

## Installation

### All vehicles

1. **⚠ WARNING:** Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

Position the RCM and install the 2 RCM bolts on the RH side.

- Tighten to 12 Nm (106 lb-in).
2. Connect the small RCM electrical connector.
  3. Install the RCM bolt on the LH side.
    - Tighten to 12 Nm (106 lb-in).
  4. Make sure the connector position assurance lever is all the way back and in the full release position before attempting to connect the connector.

5. **NOTICE:** Placing the large Restraints Control Module (RCM) electrical wiring connector into the RCM on an angle may cause bad electrical connections and damaged components.

**NOTE:** The RCM has been removed for clarity.

Position the large RCM electrical connector into the RCM .

- **NOTICE:** Do not push the connector to the point where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the Restraints Control Module (RCM), before using the lever to fully seat the connector. Damage to the connector or component may occur.

With the large RCM electrical connector uniformly aligned to the RCM , lightly push in until a subtle audible click is heard and slight resistance is felt.

6. **NOTE:** The RCM has been removed for clarity.

Connect the large RCM electrical connector.

- Using the connector position assurance lever, pivot it toward the RCM , drawing the connector into the RCM .
  - ♦ Make sure the thumb tab is engaged to the retainer on the RCM and is locked in place.

#### **Vehicles with column shifter**

7. Position the ashtray bracket, slide the retaining clips into place and install the 2 screws.
8. Install the ashtray.

#### **Vehicles with floor shifter**

9. Connect the storage compartment power point electrical connector.
10. Align the retaining clips and install the storage compartment.
11. Align the retaining clips and install the floor console finish panel.
12. Place the transmission in PARK and release the parking brake.

#### **All vehicles**

13. Position the carpet patch and install the pin-type retainer.
  14. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
  15. If a new RCM was installed, carry out the appropriate steps necessary to complete PMI . For additional information, refer to Section 418-01 .
-

**Driver Air Bag Module**

Item	Part Number	Description
1	-	Steering wheel rear cover access hole (part of 3600) (4 required)
2	-	Driver air bag module electrical connectors (part of 14A664)
3	-	Horn electrical connector
4	-	Driver air bag module locking pin (part of 043B13) (4 required)
5	043B13	Driver air bag module

**Removal**

**⚠ WARNING:** Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING:** Do not paint any air bag module trim covers or deployment doors. Paint may cause the air bag to deploy incorrectly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

**NOTICE:** Make sure the steering wheel spring clips retaining the driver air bag module are disengaged from each of the 4 locking pins on the driver air bag module before removing the driver air bag module from the steering wheel. Failure to do so will damage the driver air bag module and steering wheel.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
2. **NOTE:** A tool that has a blunt end, such as a 4.0 mm (0.15 in) Allen wrench, is better able to disengage the steering wheel spring clip from the driver air bag module locking pins.

Using a 4 mm (0.15 in) Allen wrench or suitable tool, place 2 marks on the tool as an aid to remove the driver air bag module. One mark should be approximately 35 mm (1.37 in) from the end of the tool with the second mark approximately 45 mm (1.77 in) from the end of the tool.

3. **NOTE:** The steering wheel rear cover has internal guides that direct the tool to the spring clip. Allow the steering wheel rear cover to guide the tool, minimal force is needed.

**Gently** insert the tool into a steering wheel rear cover upper access hole until the end of the tool comes into contact with an obstruction. The 45 mm (1.77 in) mark on the tool should be even or close to even with the steering wheel rear cover. If the 45 mm (1.77 in) mark on the tool is not even or close to even with the steering wheel rear cover, remove the tool from the steering wheel and carry out the step once again to correctly position the tool.

- If the 45 mm (1.77 in) mark on the tool goes into the steering wheel rear cover, the tool was directed past the steering wheel spring clip. Use a tool of a slightly larger diameter or, using the internal guides of the steering wheel rear cover, insert the tool to the 45 mm (1.77 in) mark and proceed to the next step.

4. **NOTE:** The steering wheel is removed for clarity. The upper corner of the steering wheel rear cover is cutaway to show the internal guides and the steering wheel spring clip.

With the tool correctly positioned, remove the tool approximately 2-3 mm (0.07-0.11 in) from the access hole then gently push the tool forward (toward front of vehicle). This puts the tool in the best position to disengage the steering wheel spring clip from the driver air bag module locking pin.

5. **NOTE:** Make sure to disengage the steering wheel spring clip from the driver air bag module locking pin before gently pulling the corresponding corner of the driver air bag module. No or very little force is needed to separate the corresponding corner of the driver air bag module from the steering wheel once the spring clip is disengaged from the locking pin.

**NOTE:** When the steering wheel spring clip is disengaged from the first locking pin, the corresponding corner of the driver air bag module will only separate 2-4 mm (0.07-0.15 in) from the steering wheel. The driver air bag module will separate more noticeably as subsequent locking pins are disengaged.

Push the tool deeper into the access hole (approximately 4-8 mm [0.15-0.31 in]) with enough force to disengage the steering wheel spring clip from the driver air bag module locking pin. The corresponding corner of the driver air bag module should pop up once the spring clip is disengaged from the locking pin. **Gently** pull the corresponding corner of the driver air bag module to make sure the locking pin does not re-engage the spring clip. Remove the tool from the access hole. Discontinue pulling on the corresponding corner of the driver air bag module.

- If the corresponding corner of the driver air bag module does not easily separate from the steering wheel, the spring clip is not disengaged from the locking pin. Repeat the steps to position the tool correctly and disengage the spring clip from the locking pin.

6. **NOTE:** The steering wheel rear cover has internal guides that assist in directing the tool to the correct location. Allow the steering wheel rear cover to guide the tool, minimal force is needed.

Working on the same side of the steering wheel, **gently** insert the tool into a steering wheel rear cover lower access hole until the end of the tool comes into contact with an obstruction. The 35 mm (1.37 in) mark on the tool should be even or close to even with the steering wheel cover. If the 35 mm (1.37 in) mark on the tool is not even or close to even with the steering wheel cover, remove the tool from the access hole and carry out the step again to position the tool correctly.

- If the 35 mm (1.37 in) mark on the tool goes into the steering wheel rear cover, the tool was inserted past the steering wheel spring clip. Use a tool of a slightly larger diameter or, using the internal guides of the steering wheel rear cover, insert the tool to the 35 mm (1.37 in) mark and proceed to the next step.

7. **NOTE:** The steering wheel is removed for clarity. The lower corner of the steering wheel rear cover is cutaway to show the internal guides and the steering wheel spring clip.

With the tool correctly positioned, remove it approximately 2-3 mm (0.07-0.11 in) out of the access hole then gently push the tool forward (toward front of vehicle). This puts the tool in the best position to disengage the steering wheel spring clip from the driver air bag module locking pin.

8. **NOTE:** Make sure to disengage the steering wheel spring clip from the driver air bag module locking pin before gently pulling the corresponding corner of the driver air bag module. No or very little force is needed to separate the corresponding corner of the driver air bag module from the steering wheel once the spring clip is disengaged from the locking pin.

Push the tool deeper into the access hole (approximately 3-6 mm [0.11-0.23 in]) with enough force to disengage the steering wheel spring clip from the driver air bag module locking pin. The corresponding corner of the driver air bag module should pop up once the spring clip is disengaged from the locking pin. **Gently** pull the corresponding corner of the driver air bag module to make sure the locking pin does not reengage the spring clip. Remove the tool from the access hole. Discontinue pulling on the corresponding corner of the driver air bag module.

- If the corresponding corner of the driver air bag module does not easily separate from the steering wheel the spring clip is not disengaged from the locking pin. Repeat the necessary steps to correctly position the tool and disengage the spring clip from the locking pin.

9. **NOTE:** Disengage the steering wheel spring clips from the 2 locking pins on one side of the driver air bag module before proceeding to the other side.

Repeat the above steps to disengage the 2 remaining driver air bag module locking pins.

10. Remove the driver air bag module.

1. Release the driver air bag module electrical wiring from the driver air bag wiring clip.
2. Squeeze the tabs and disconnect the driver air bag module electrical connector.
3. Squeeze the tabs and disconnect the driver air bag module electrical connector.

4. Disconnect the horn electrical connector.
5. Remove the driver air bag module.

## Installation

1. Connect the driver air bag module.
  1. Connect the horn electrical connector.
  2. **NOTICE:** Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.

Connect the driver air bag module electrical connectors as noted during removal.

3. Install the driver air bag module electrical wiring into the driver air bag wiring clip.

2. **NOTE:** With the driver air bag module held as close to the steering wheel as possible, take up the slack in the wiring by gently tucking any excess length into the pocket at the bottom of the steering wheel before rocking the driver air bag module into place.

Align the 4 driver air bag module locking pins to the openings in the steering wheel and position the driver air bag module in place.

3. With the locking pins aligned and the driver air bag module positioned to the steering wheel, push inward seating the 4 locking pins to the spring clips.
  - An audible click should be heard when the driver air bag module locking pins are seated in place to the spring clip.

- When the 4 locking pins are seated in place, there should be an even uniform gap between the driver air bag module trim cover and the steering wheel.

4. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
-

**Passenger Air Bag Module**

Item	Part Number	Description
1	046A62	RH instrument panel trim panel
2	-	Rear window defrost switch electrical connector (part of 14401)
3	-	Passenger Air Bag Deactivation (PAD) indicator electrical connector (part of 14401)
4	N807122	Passenger air bag module deployment door bolts
5	044A74	Passenger air bag module
6	-	Passenger air bag module electrical connector pin-type retainer
7	W705314	Passenger air bag module bolts
8	-	Passenger air bag module electrical connector (part of 14401)

**Removal and Installation**

**⚠ WARNING:** Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING: Do not paint any air bag module trim covers or deployment doors. Paint may cause the air bag to deploy incorrectly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.**

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
  2. Remove the RH instrument panel trim panel.
    - Pull out to release the retaining clips.
    - Slide the RH instrument panel trim panel slightly to the right, aligning the keyway.
    - Disconnect the rear window defrost switch electrical connector.
    - If equipped, disconnect the clock electrical connector.
    - Disconnect the Passenger Air Bag Deactivation (PAD) indicator.
    - Remove the trim panel.
  3. Disconnect the passenger air bag module electrical connector.
    - Through the glove compartment opening, separate the passenger air bag module electrical connector and pin-type retainer from the bracket.
    - Disconnect the electrical connector.
  4. Remove the 2 passenger air bag module bolts.
    - To install, tighten to 9 Nm (80 lb-in).
  5. **NOTICE: Do not handle the passenger air bag module by the edges of the deployment doors. Damage to the air bag module may occur.**

Remove the 2 passenger air bag module deployment door bolts and passenger air bag module.
  6. To install, reverse the removal procedure.
  7. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
-

SECTION 501-20B: Supplemental Restraint  
System  
REMOVAL AND INSTALLATION

2010 Crown Victoria, Grand Marquis Workshop  
Manual  
Procedure revision date: 08/19/2009

## Side Air Bag Module

**NOTE:** RH shown, LH similar.

Item	Part Number	Description
1	60770	Seat back trim panel (police only)
2	-	Seat back trim panel screws (police vehicles only) (2 required)
3	N620480	Side air bag module nuts
4	64416	Seat backrest cover
5	64810	Seat backrest foam pad
6	611D10	Side air bag module
7	-	Side air bag module electrical connector (part of 14716)

### Removal

**⚠ WARNING:** Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

**⚠ WARNING:** Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

**⚠ WARNING:** If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the

**seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

**⚠ WARNING:** Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

**NOTE:** If a side air bag deployment took place, the backrest foam pad, cover and side air bag module must be installed new. The seatback frame should be installed new if necessary.

**NOTE:** When installing a new side air bag after deployment, refer to Section 501-10 for additional information concerning the installation of a new side air bag.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

### All vehicles

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

### Police vehicles

2. Remove the zippers from under the material, unzip both the zippers and position the seat backrest cover up to access the seat back trim panel.

3. Remove the seat back trim panel.
  1. Remove the 2 screws located at the bottom of the seat back trim panel.
  2. Pull out at the bottom and slide the seat back trim panel up to disengage the 2 upper retaining hooks.

### Non-police vehicles

4. Release the 3 seat back cover J-clips.
  - Release the lower J-clip.

- Release the 2 side J-clips.

### All vehicles

5. Remove the outboard hog rings that attach the foam pad to the seat backrest frame.

6. **NOTE:** If installing a new side air bag module, use new retaining nuts. If the same side air bag module is to be reused, reuse the side air bag module nuts.

Remove the 2 side air bag module nuts.

7. Position the side air bag module and deployment chute away from the mounting bracket and seat back frame.

8. Position the seat back cover and seat back pad forward enough to access the side air bag module.

9. Remove the side air bag module from the deployment chute.

- Pull the side air bag module mounting studs back through the deployment chute openings and remove the side air bag module from the deployment chute.

10. Disconnect the electrical connector and remove the side air bag module.

### Installation

**All vehicles**

1. Connect the side air bag module electrical connector.
2. **⚠ WARNING: Before installing the seat side air bag module/deployment chute assembly:**
  - ◆ Inspect the side air bag module and mounting surfaces for any damage or foreign material.
  - ◆ Remove any foreign material from the mounting surfaces of the deployment chute, the seat backrest frame mounting bracket and the air bag module cavity in the seat backrest foam pad.
  - ◆ Install new parts if damaged.

Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

**⚠ WARNING: Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

**⚠ WARNING: If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

**⚠ WARNING: Check the seat side air bag deployment chute for damage. The deployment chute must not be repaired. If there is any damage to the deployment chute, a new seat back trim cover and deployment chute must be installed as a unit. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

**⚠ WARNING: If the seat side air bag module deployment chute is not correctly positioned and closed, the seat side air bag module may not deploy correctly. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

**NOTE:** The alignment pin will only allow the side air bag module to be installed to the seat back mounting bracket one way.

Position the side air bag module into the deployment chute.

- Position the side air bag module into the deployment chute with the alignment pin offset to the top and the electrical connector to the bottom of the seat back. This will position the alignment pin correctly when the side air bag module and deployment chute are mounted to the seat back frame mounting bracket.
- The side air bag module mounting studs and alignment pin must come through the deployment chute stud openings.

3. **⚠ WARNING: Before installing the seat side air bag module/deployment chute assembly:**

- ◆ Inspect the side air bag module and mounting surfaces for any damage or foreign material.
- ◆ Remove any foreign material from the mounting surfaces of the deployment chute, the seat backrest frame mounting bracket and the air bag module cavity in the seat backrest foam pad.
- ◆ Install new parts if damaged.

Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

**⚠ WARNING: Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

Install the side air bag module onto the front seat back frame mounting bracket and 2 nuts.

- The deployment chute should not have any wrinkles or folds where it contacts the seat back frame mounting bracket.
- Tighten to 7 Nm (62 lb-in).

4. Make sure the seat backrest cover deflector flap is positioned with no wrinkles or folds between the cover and seat back pad.

5. Reposition the seat back pad and cover to the seat back frame.

6. Install the outboard hog rings that attach the foam pad to the seat backrest frame.

- Make sure the hog rings go around the listing wire in the foam pad as well as the backrest frame wire.

**Non-police vehicles**

7. **NOTE:** Note the alignment of the 2 side J-clips at the top of the seat to avoid bunching.

Attach the 3 seat back cover J-clips.

- Attach the 2 side J-clips.
- Attach the lower J-clip.

### Police vehicles

8. **NOTICE:** Inspect the seat back trim panel retaining hooks for damage. If damaged, install a new seat back trim panel.

Install the seat back trim panel.

1. Angle the top of the seat back trim panel inward and down to engage the 2 upper retaining hooks to the seat back frame.
2. Push in on the lower seat back trim panel and install the 2 screws.

9. Pull the seat backrest material down, zip both the zippers and tuck the zippers under the material.

### All vehicles

10. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
-

**Clockspring**

Item	Part Number	Description
1	3530	Upper steering column shroud
2	14A664	Clockspring
3	-	Clockspring electrical connector (part of 14401)
4	3F609	Tilt column lever
5	3530	Lower steering column shroud
6	W710485	Lower steering column shroud screws

**Removal**

**⚠ WARNING:** Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the driver air bag module. For additional information, refer to [Driver Air Bag Module](#) in this section.
2. **NOTICE:** Make sure the road wheels are in the straight-ahead position. Failure to follow this instruction may cause damage to the clockspring.

Remove the steering wheel. For additional information, refer to [Section 211-04](#).

3. Apply 2 strips of masking tape across the clockspring to prevent accidental rotation when the clockspring is removed.

4. Position the tilt steering column all the way up to allow for upper and lower steering column shroud removal.
5. Remove the tilt column lever.
6. Remove the 3 lower steering column shroud screws.
7. Release the retainers to the upper steering column shroud and remove the lower steering column shroud.
8. Remove the upper steering column shroud.
9. Disconnect the clockspring electrical connector.
10. Release the 3 retaining clips and remove the clockspring.

## Installation

### Vehicles receiving a new clockspring

1. **NOTE:** A new clockspring is supplied in a centralized position and held in position with a key.

Remove the key from the clockspring, holding the rotor in its centralized position.

- Do not allow the clockspring rotor to move.

### Vehicles needing clockspring recentering

**⚠ WARNING:** If the clockspring is not correctly centralized, it may fail prematurely. If in doubt, repeat the centralizing procedure. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.

**NOTE:** If a clockspring has rotated out of center, carry out the following steps.

2. **NOTICE:** Overturning will destroy the clockspring. The internal ribbon wire acts as the stop and may be broken from its internal connection.

Rotate the rotor counterclockwise until it stops.

- While rotating the rotor counterclockwise, carefully feel for the ribbon wire to run out of length. Stop when a slight resistance is felt.

3. Rotate the rotor clockwise and stop when the arrows line up.

4. Rotate the rotor clockwise 2 complete turns and line up the arrows. Stop rotating at this point. This is the center point of the clockspring.
  - Do not allow the rotor to move from this position.

### Vehicle repairs reusing the same clockspring

5. **NOTE:** When the tape is removed, do not allow the rotor to move.

Remove the tape applied during clockspring removal.

### All vehicles

6. **NOTE:** Slight rotor rotation is allowable for alignment purposes to the steering column.

With the flats of the clockspring aligned to the flats of the steering column, slide the clockspring onto the steering column engaging the retaining tabs.

7. Connect the clockspring electrical connector.

8. Position the upper steering column shroud.
    - If equipped, engage the column shift lever boot to the upper steering column shroud.
  9. Position and engage the lower steering column shroud to the column shift lever boot and upper steering column shroud and install the 3 screws.
  10. Install the tilt column lever.
  11. Install the steering wheel. For additional information, refer to Section 211-04 .
  12. Install the driver air bag module. For additional information, refer to Driver Air Bag Module in this section.
-

**Occupant Classification Sensor**

## Special Tool(s)

 ST2834-A	<b>Vehicle Communication Module (VCM)</b> <b>and Integrated Diagnostic System (IDS)</b> software with appropriate hardware, or equivalent scan tool
---	--

**Seat with OEM Occupant Classification System (OCS)**

Item	Part Number	Description
1	62900	Seat cushion cover
2	-	Seat cushion pad
3	-	Pin-type retainers
4	-	Power lumbar switch electrical connector (part of 14A699)
5	14A706	Power lumbar switch and bezel
6	61198	Seat backrest recliner handle
7	-	Occupant Classification System Module (OCSM)
8	-	OCSM rivets
9	-	OCSM bracket

10	-	OCSM bracket rivet
11	63100	Seat cushion frame
12	-	Occupant Classification System (OCS) (bladder and hose with pressure sensor)
13	-	Heater mat electrical connector

**Seat with a Service Kit Occupant Classification System (OCS)**

Item	Part Number	Description
1	62900	Seat cushion cover
2	632A22	Occupant Classification System (OCS) system service kit (foam pad, bladder, hose with pressure sensor, Occupant Classification System Module (OCSM) and wiring harness)
3	-	Power lumbar switch electrical connector (part of 14A699)
4	14A706	Power lumbar switch and bezel
5	61198	Seat backrest recliner handle
6	-	OCS service kit electrical connector (part of service kit 632A22)
7	-	OCSM bracket
8	-	OCSM bracket rivet
9	63100	Seat cushion frame
10	-	OCSM rivet (2 required)
11	-	Heater mat electrical connector (if equipped, part of 14D698)

**Removal****Seat with OEM Occupant Classification System (OCS)**

**⚠ WARNING:** Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

**NOTE:** To identify between a production Occupant Classification System (OCS) system and an OCS system service kit, inspect the Occupant Classification System Module (OCSM) electrical connector. A production OCS system allows the disconnect of the OCSM electrical connector. An OCS system service kit has the OCSM electrical connector glued to the module. It cannot and should not be disconnected or altered.

**NOTE:** The heater mat on the front passenger seat cushion is not serviceable separately. If a new heater mat is needed on the front passenger seat cushion, a new OCS system service kit and a new heater mat must be installed.

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

#### All seats

1. Remove the front passenger seat. For additional information, refer to [Section 501-10](#).
2. Remove the front seat backrest. For additional information, refer to [Section 501-10](#).
3. Remove the seat track. For additional information, refer to [Section 501-10](#).

#### Heated seats

4. Disconnect the seat cushion heater mat electrical connector.

#### Seats with manual recline

5. Remove the seat backrest recliner handle.

#### Seats with power lumbar

6. Release the tabs at the front and back to separate the power lumbar switch and bezel from the seat cushion frame.
7. Disconnect the electrical connector and remove the power lumbar switch.

#### All seats

8. Release the remaining seat cushion cover J-clips.
9. **NOTICE:** It is necessary to carry out the Occupant Classification System (OCS) system reset when a front passenger seat cushion is disassembled, a new seat cushion cover installed or an OCS service kit is installed. A scan tool is used to carry out the OCS system reset.

**NOTICE:** Use care when separating the seat cushion cover from the hook-and-loop strip. The hook-and-loop strip can be torn from the seat cushion foam. Failure to follow this procedure can result in component damage and/or system failure.

Separate the hook-and-loop strips. Position the seat cushion cover aside.

10. Bend the retaining tab holding the pressure sensor in place down and aside.

### Seats with an original equipment Occupant Classification System (OCS) system

11. Remove the seat cushion pad from the seat cushion frame.

12. If necessary, remove the 2 pin-type retainers and the mat, otherwise position the mat aside.

13. Remove the OCSM and separate the pressure sensor from the OCSM bracket.

1. Release the pressure sensor hose.
2. Disconnect the electrical connector and slide the pressure sensor off the bracket.
3. **NOTICE: Do not oversize the seat cushion frame holes used to rivet the Occupant Classification System Module (OCSM) in place. Failure to follow these instructions may result in incorrect operation of the Occupant Classification System (OCS) system and may cause system failure.**

Using a 5 mm (3/16 in) drill, remove the 3 rivets.

4. Remove the OCSM bracket.
5. Disconnect and remove the OCSM .

14. Remove the pin-type retainers holding the occupant classification sensor bladder to the seat cushion frame.

15. **NOTE:** Make note of the opening that the pressure sensor and hose are being fed through on the seat cushion support assembly for installation purposes.

Separate the OCS bladder and pressure sensor from the seat cushion frame.

- Feed the pressure sensor and hose through the seat cushion support assembly.

### Seats with an OCS system service kit

16. Separate the OCS system components from the seat cushion frame.

1. Release the pressure sensor hose.
2. Slide the pressure sensor off the bracket.
3. Cut the tie-straps.
4. **NOTICE:** Do not oversize the seat cushion frame holes used to rivet the Occupant Classification System Module (OCSM) in place. Failure to follow these instructions may result in incorrect operation of the Occupant Classification System (OCS) system and may cause system failure.

Using a 5 mm (3/16 in) drill, remove the 3 rivets.

5. Remove the OCSM bracket.
6. Disconnect the service part OCS electrical connector.

17. **NOTE:** Make note of the opening that the OCS system components are being fed through on the seat cushion support assembly for installation purposes.

Remove the OCS system from the seat cushion frame.

- Feed the hose, pressure sensor, wire harness, electrical connector and OCSM through the seat cushion frame support assembly.

18. If necessary, remove the 2 pin-type retainers and the cushion mat. Otherwise, position the mat aside.

### Installation

**⚠ WARNING:** Occupant Classification System (OCS) parts are calibrated as an assembly and must only be replaced in the configuration they are sold. Never separate parts of an assembly. Failure to follow this instruction may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.

## All seats

1. Bend the pressure sensor bracket retaining ear back so it will engage upon assembly.

## Vehicles with heated seats

2. **NOTE:** The heater mat on the front passenger seat cushion is not serviceable separately. If a new heater mat is needed on the front passenger seat cushion, a new OCS system service kit and a new heater mat must be installed.

Attach the heater mat to the seat cushion pad.

## Seats having the original equipment OCS system installed

3. **NOTICE:** Failure to route the seat Occupant Classification System (OCS) system components through the correct seat cushion support opening can cause system failure and incorrect OCS system operation.

**NOTICE:** Inspect the Occupant Classification System (OCS) system assembly, seat cushion frame and support assembly for any foreign objects before installing the OCS system assembly to the seat cushion frame. If any foreign objects are found, remove them. Failure to follow this instruction may result in system failure and the incorrect operation of the OCS system.

Position the OCS system assembly to the seat cushion frame.

- Feed the pressure sensor with hose through the largest opening at the front of the seat cushion frame support assembly as noted during removal.

4. **NOTICE:** Inspect the Occupant Classification System (OCS) bladder, seat cushion frame and support assembly for any foreign objects, before installing the OCS system to the seat cushion frame. If any foreign objects are found, remove them. Failure to follow this instruction may result in system failure and the incorrect operation of the OCS system.

Install the pin-type retainers holding the OCS bladder to the seat cushion frame.

5. If the cushion mat was removed, position the mat over the bladder and install pin-type retainers, otherwise position the mat over the bladder.
6. Attach and connect the OCS system components.

1. Position the OCSM to the seat cushion frame and connect the electrical connector.
2. Install the 2 rivets to hold the OCSM in place.
3. Position the OCSM bracket through the opening in the front of the seat cushion frame.
4. Install the OCSM bracket rivet.
5. Install the pressure sensor onto the seat cushion frame bracket, making sure the retaining ear is completely engaged.
  - ◆ Connect the pressure sensor electrical connector.
6. Attach the pressure sensor hose.

7. **NOTICE:** Inspect the seat cushion pad and frame for any foreign objects before installing the seat cushion frame to the seat cushion pad. If any foreign objects are found, remove them. Failure to follow this instruction may result in system failure and the incorrect operation of the Occupant Classification System (OCS) system.

Install the seat cushion pad to the seat cushion frame.

#### Seats having an OCS system service kit installed

8. **NOTICE:** Inspect the Occupant Classification System (OCS) system assembly, seat cushion frame and support assembly for any foreign objects, before installing the OCS system assembly to the seat cushion frame. If any foreign objects are found, remove them. Failure to follow this instruction may result in system failure and the incorrect operation of the OCS system.

**NOTICE:** Failure to route the seat Occupant Classification System (OCS) system components through the correct seat cushion support opening can cause component failure.

**NOTE:** If the original equipment OCS system is not being installed, install a OCS system service kit using all parts in the kit.

Position the OCS assembly to the seat cushion frame.

- Using an OCS system service kit, feed the OCSM , electrical connector, wire harness, pressure sensor and hose through the largest opening at the front of the seat cushion frame support assembly as noted during removal.
  - ◆ Position the seat cushion pad and bladder to the seat cushion frame.

9. **NOTE:** When installing a OCS system service kit, the main seat wire harness pressure sensor electrical connector does not get used.

Attach and connect the OCS system components.

1. Position the OCSM onto the seat cushion frame and install the 2 rivets.
2. Position the OCSM bracket through the opening in the front of the seat cushion frame.
3. Install the OCSM bracket rivet.
4. Install the pressure sensor onto the seat cushion frame bracket, making sure the retaining ear is completely engaged.
5. Attach the pressure sensor hose.
6. Connect the main seat wire harness OCSM electrical connector to the OCSM service part electrical connector.
7. Tie-strap all loose wire harnesses and electrical connectors safely aside.

### All seats

10. Align the seat cushion cover to the seat cushion pad and fasten the hook-and-loop strips.

11. Position the seat cushion cover and attach the J-clips.

### Seats with power lumbar

12. Connect the power lumbar switch electrical connector.
13. Attach the power lumbar switch and bezel to the seat.

### Seats with manual recline

14. Install the seat backrest recliner handle.

### Heated seats

15. Connect the seat cushion heater mat electrical connector.

### All seats

16. Install the seat track. For additional information, refer to [Section 501-10](#).
17. Install the front seat backrest. For additional information, refer to [Section 501-10](#).
18. Install the front passenger seat. For additional information, refer to [Section 501-10](#).

19. **⚠ WARNING:** Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increases the risk of serious personal injury or death in a crash.

**NOTICE:** To prevent system failure, the following precautions must be taken before carrying out the Occupant Classification System (OCS) system reset:

- ◆ Make sure the voltage to the Occupant Classification System Module (OCSM) is above 8 volts and less than 18 volts.
- ◆ Make sure the OCS system is not at a temperature below 6°C (42°F) or above 36°C (97°F) when initiating the OCS system reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature within the limits, 6°C to 36°C (42°F to 97°F) for a minimum of 30 minutes.
- ◆ Make sure nothing is present on the passenger seat before carrying out the OCS system reset and nothing is placed on the seat during the process.
- ◆ Make sure a minimum 8-second time period has passed after cycling the ignition ON before the carrying out the OCS system reset.

Carry out the Occupant Classification System (OCS) System Reset.

20. If the first system reset attempt was unsuccessful, carry out a thorough visual inspection of the following and repair any concerns found.
- OCS system connector wiring for damage
  - Pressure sensor hose for kinks and/or damage
  - Seat-related wiring harness and body wiring harness terminals and connectors for damage
21. Carry out a second OCS system reset. If the second attempt is unsuccessful, install a new OCS system service kit. For additional information, refer to Occupant Classification Sensor in the Removal and Installation portion of Section 501-20B.
22. Cycle the ignition switch from ON to OFF.
23. **NOTE:** The ignition switch must be cycled after the OCS system reset.

Cycle the ignition switch from OFF to ON.

24. Prove out the SRS as follows:
- Turn the ignition from ON to OFF. Wait 10 seconds, then turn the ignition back to ON and monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will:
- fail to light.
  - remain lit continuously.
  - flash.
- The flashing might not occur until approximately 30 seconds after the ignition has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS faults discovered must be diagnosed and repaired.
- Clear all continuous DTCs from the RCM using a scan tool.

25. **NOTE:** When installing a new OCS system service kit, a prepaid return postcard is provided with the new OCS. The serial number for the new part and the Vehicle Identification Number (VIN) must be

SECTION 501-20B: Supplemental Restraint  
System  
REMOVAL AND INSTALLATION

2010 Crown Victoria, Grand Marquis Workshop  
Manual  
Procedure revision date: 08/19/2009

## Seat Position Sensor

### Vehicles with Power Seats

Item	Part Number	Description
1	14B416	Seat position sensor
2	W611624	Seat position sensor bolt
3	-	Seat position sensor electrical connector (part of 14A669)
4	W611624	Magnet assembly bolt
5	14B417	Magnet assembly

### Vehicles with Manual Seats

Item	Part Number	Description
1	-	Seat position sensor electrical connector (part of 14A669)
2	14B416	Seat position sensor

3	W611624	Seat position sensor bolt
---	---------	---------------------------

**Removal and Installation**

**NOTE:** The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

**NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

**All vehicles**

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

**Vehicles with power seats**

2. Disconnect the seat position sensor electrical connector.
3. Remove the seat position sensor bolt.
  - To install, tighten to 9 Nm (80 lb-in).
4. Remove the seat position sensor.
  - Press the sensor tab inward to release and remove the seat position sensor.
5. Remove the magnet assembly bolt.
  - To install, tighten to 9 Nm (80 lb-in).
6. Remove the magnet assembly.
  - Slide the magnet assembly rearward to release the front tab to remove the magnet assembly.

**Vehicles with manual seats**

7. Disconnect the seat position sensor electrical connector.
8. Remove the bolt and the seat position sensor.
  - To install, tighten to 9 Nm (80 lb-in).

**All vehicles**

9. To install, reverse the removal procedure.
  10. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.
-

**Passenger Air Bag Deactivation (PAD) Indicator**

Item	Part Number	Description
1	046A62	RH instrument panel trim panel
2	10A936	Passenger Air Bag Deactivation (PAD) indicator
3	-	PAD indicator electrical connector (part of 14401)

1. **NOTE:** Ignition must be OFF if disconnecting the Passenger Air Bag Deactivation (PAD) indicator electrical connector. Otherwise, a DTC will be set in the Restraints Control Module (RCM) memory and must be cleared before releasing the vehicle.

Turn the ignition OFF and wait at least one minute.

2. Separate the RH instrument panel trim panel.
  - Pull out to release the retaining clips.
  - Slide the RH instrument panel trim panel slightly to the right, aligning the keyway.
  - Pull out, separating the RH instrument panel trim panel.

3. Disconnect the electrical connector, release the retainers and remove the PAD indicator.

4. To install, reverse the removal procedure.
-

**Descriptions of Ford Steel Families**

Grade	Alloy Content	Heat Treatment	Typical Applications	Comments
Mild Steel, Bake Hardened, Solid Solution Strengthened	Low	Fully annealed/dead soft	Body panels (closures, floor pan, dash panel)	-
High-Strength Low Alloy (HSLA)	Low	Fully annealed/dead soft	Rails, structural members	Strengthened with fine particles and small grain size
Dual Phase	Medium (Manganese Silicon, Molybdenum Chromium)	Fully annealed/partially hardened	Rails, structural members	15-50% of structure is hard martensite
Ultra High Strength Steel (UHSS) (Martensitic, Boron)	Low	Fully hardened	Rocker reinforcements, door beams, bumper beams	100% of structure is hard martensite
Transformation Induced Plasticity Steel	High (Manganese, Phosphorous, Silicon, Aluminum)	Fully annealed/partially hardened	To be determined	Complex microstructure for high strength and ductility

**Ford Recommended Steel Repairability Matrix**

Grade	Trade Descriptions	Welding Method			Cold Repairs	Use of Heat for Repair	Temperature Range	Maximum Heat

2010 Crown Victoria, Grand Marquis Workshop Manual

High- Strength Low Alloy (HSLA)	HSLA 250, HSLA 350, HSLA 550	Yes	Yes	Yes <sup>b</sup>	Yes <sup>a</sup>	Yes	Up to 650°C (1,200°F)	90 sec. x 2
Dual Phase = 600 MPa Ultimate Tensile Strength	DP 500, DP 600	Yes	Yes	Yes <sup>b</sup>	Yes <sup>a</sup>	No	NA	NA
Dual Phase = 600 MPa Ultimate Tensile Strength (particular to 780 and 980 grades) <sup>c</sup>	DP 700, DP 780, DP 900	Yes <sup>d</sup>	Yes	Yes <sup>b</sup>	No	No	NA	NA
Ultra High Strength Steel (UHSS) (Martensitic, Boron) <sup>e</sup>	Boron	Yes <sup>a</sup>	Yes	Yes <sup>b</sup>	No	No	NA	NA
Transform- ation Induced Plasticity (TRIP) Steel	TRIP 590, TRIP 780, TRIP 980	NA	NA	NA	NA	NA	NA	NA

<sup>a</sup> Cold repairs can be performed if damage excludes kinks. May section only if approved procedure in workshop manual.

<sup>b</sup> MIG braze allowed for non-structural applications only.

<sup>c</sup> Dual phase steels DP 700, DP 780 and DP 980 must be replaced at factory joints, no sectioning unless approved procedure in workshop manual.

<sup>d</sup> For DP 980, use MIG plug welding only, no stitch welding.

<sup>e</sup> Boron components must be replaced at factory joints, no sectioning allowed.

**Body**

The body consists of the following:

- Body on full frame design
- Standard 2,913 mm (114.68 in) and long 3,066 mm (120.7 in) wheelbase
- Long wheelbase has a larger rear door/door frame opening
- High-Strength Low Alloy (HSLA), high-strength and mild steels
- Bolted, removable front fenders, hinged doors, luggage compartment lid and hood
- Steel radiator support
- Steel hood
- Steel fenders
- Steel doors
- Steel luggage compartment lid
- Sheet-Molded Composite (SMC) Grille Opening Panel (GOP)
- High-strength, roll-formed, bolt-on front and rear bumper beams
- Welded steel reinforcement used in rocker panel(s)
- Fire suppression system used on certain municipal and state law enforcement vehicles
- Fire suppression system frame contains welded steel reinforcement inserts in the rear frame rails
- Fire suppression system frame uses 21 additional reinforcements

For dimensional information, refer to the following illustrations:

**Body Margins**

**NOTE:** Dimensions apply to right and left side.

Item	Description	Specification	Flushness Specification
1	Hood to fender	4.0 mm (0.15 in) $\pm$ 2.0 mm (0.07 in)	-
2	Fascia to lamp assembly	2.0 mm (0.07 in) $\pm$ 1.0 mm (0.03 in)	0.0 mm ( in) $\pm$ 2.5 mm (0.098 in)

4	Grille to fascia	6.0 mm (0.23 in) $\pm$ 2.0 mm (0.07 in)	-
5	Hood to grille opening panel	4.0 mm (0.15 in) $\pm$ 2.0 mm (0.07 in)	0.7 mm (0.027 in) $\pm$ 1.5 mm (0.059 in)

**Body Margins****NOTE:** Dimensions apply to right and left side.

Item	Description	Specification	Flushness Specification
6	Door to fender	4.0 mm (0.15 in) $\pm$ 2.0 mm (0.07 in)	0.0 mm ( in) $\pm$ 2.0 mm (0.078 in)
7	Door(s) to roof	5.0 mm (0.19 in) $\pm$ 2.0 mm (0.07 in)	-
8	Front door to rear door	4.0 mm (0.15 in) $\pm$ 2.0 mm (0.07 in)	0.0 mm ( in) $\pm$ 2.0 mm (0.078 in)
9	Rear door to quarter panel	4.0 mm (0.15 in) $\pm$ 2.0 mm (0.07 in)	0.0 mm ( in) $\pm$ 2.0 mm (0.078 in)

**Body Margins****NOTE:** Dimensions apply to right and left side.

Item	Description	Specification	Flushness Specification
10	Quarter panel to luggage compartment lid	4.0 mm (0.15 in) $\pm$ 2.0 mm (0.07 in)	-
11	Lamp assembly to luggage compartment lid	6.0 mm (0.23 in) $\pm$ 3.0 mm (0.11 in)	-
12	Luggage compartment lid to fascia	9.0 mm (0.35 in) $\pm$ 3.0 mm (0.11 in)	-
13	Lamp assembly to fascia	5.0 mm (0.19 in) $\pm$ 2.0 mm (0.07 in)	0.0 mm ( in) $\pm$ 2.0 mm (0.078 in)

**Underhood Dimensions****NOTE:** Measurements are obtained on center, unless otherwise indicated.

## Body Side Closure Dimensions

### Standard Wheelbase

**NOTE:** Measurements are obtained on center, unless otherwise indicated.

**NOTE:** Left side shown, right side similar.

## Rear Opening Dimensions

**NOTE:** Measurements are obtained on center, unless otherwise indicated.

**NOTE:** Left side shown, right side similar.

**NOTE:** Measurements are obtained on center, unless otherwise indicated.

## Underbody Dimensions

**⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to **Section 100-02B**. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

**NOTE:** Datum height determined measuring from holes and slots on center, unless otherwise indicated.

**NOTE:** Inset views indicated from left side of vehicle.

## Frame Datum Height

#### Frame Dimensions - Standard Wheelbase

**NOTICE:** A structural frame rail or unibody service kit may be available for this vehicle. If a kit is available, refer to the included instruction sheet for installation guidelines. If no instruction sheet is included with the service part, it is mandatory that the replacement section be installed as delivered at the original factory seam locations. Refer to **Frame Members** in this section.

**NOTE:** All vehicle frames contain welded steel reinforcements, located in the rear frame rails near the control arm area. A welded steel insert is also contained in the front torque box area located at the A1 and A2 master locator holes. Care must be exercised when attempting to restore the vehicle to pre-accident dimensions, particularly if heat is applied when carrying out repairs to these areas. Vehicles with fire suppression systems have additional reinforcements located in the rear side members.

**NOTE:** Measurements are obtained on center, unless otherwise indicated.

#### Frame Dimensions - Long Wheelbase

**NOTE:** Measurements are obtained on center, unless otherwise indicated.

**⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to **Section 100-02B** . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

If equipped with an air suspension system, reactivate the power supply. This can be accomplished by reconnecting the battery or turning on the air suspension service switch located in the luggage compartment LH side.

#### Nylon Inserts with Adhesive Location - Frame-Front

#### Steel Reinforcement and Structural Foam Location - Frame-Rear

0.9 + 0.7 + 0.9	4.3 mm (0.16 in)

### General Specifications

Item	Specification
Plug weld hole	8 mm (0.31 in)
Weld wire ER70S-3 or equivalent	0.9-1.1 mm (0.035-0.045 in)

**⚠ WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.**

The correct equipment and settings must be used when welding mild or high-strength steel. Metal Inert Gas (MIG) and Squeeze-Type Resistance Spot Welding (STRW) are the preferred methods. Surfaces must be clean and free of foreign materials.

- Correct eye protection must be worn.
- The correct protective clothing should always be worn.
- Adequate ventilation must be provided to avoid accumulation of poisonous gases.
- A test weld should always be carried out on a test sample.
- Use cleaning brushes and abrasive grinding wheels dedicated to the type of materials being welded.
- Follow equipment manufacturer's prescribed procedures and equipment settings for the type of welder being used. ER70S-3 or ER70S-6 wire are typically used for MIG welding steel.
- Disconnect the battery ground cable. Refer to [Section 414-01](#).
- Disconnect on-vehicle modules and protect them from possible heat damage and electrical currents when welding.
- Corrosion protection must be restored whenever bare metal repairs are made. Refer to [Restoring Corrosion Protection Following Repair](#) in this section.
- Adequate power supply needs to be used to make sure of correct equipment performance.
- Factory spot welds may be substituted with either STRW or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.
- Vehicles equipped with optional safety canopy require removal of these components prior to any welding procedures being carried out in the roof-line or body side areas of the vehicle. Refer to [Section 501-20B](#).

---

## Sealers

**⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

The correct sealing of joints is essential to repairing the vehicle correctly. Sealers are used to prevent wind noise, water leaks, exhaust fumes and dust from entering the vehicle. They also provide anti-corrosion barriers. Sealers are applied to areas such as door and rear compartment hem flanges, wheelhouse, quarter outer, floor, cowl, roof and other panel-to-panel attaching points. The following joint sealers are recommended for use depending upon the application:

- **Brushable Seam Sealer** - A sealer intended to restore the original brushed seam appearance. It is used to seal lap joints in sheet metal that are spot welded (for example, floorpans and cowl). Use a product obtained locally.
- **Roof Ditch Sealer** - A self-leveling sealer used for drip rails, roof seams, quarter panels to rear deck and for water leaks.
- **Seam Sealer** - Heavy-bodied, non-sag adhesive/sealer for use on standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans. Also used for water leaks and noise concerns.

Sealers should remain flexible after curing and must be paintable. Follow the manufacturer's directions for correct application of these materials.

Any damage to originally sealed joints should be repaired by resealing. Along with attaching points of new panels, open joints that require bridging of sealer to close a gap should be sealed using a heavy-bodied sealer.

---

**Plastic Components****Exterior Painted Plastic Components - Crown Victoria, Grand Marquis**

**NOTE:** The following illustration(s) are not all-inclusive of trim levels available. The actual trim level of the vehicle will determine the viability of carrying out a plastic repair.

Item	Part Number	Description
1	17D957	Bumper cover (front) - Thermoplastic Olefin (TPO)
2	20879B LH/ 20878B RH	Door moulding - TPO
3	20878A LH/ 20879A RH	Door moulding - TPO
4	25557B LH/ 25556B RH	Door moulding - TPO
5	17K835	Bumper cover (rear) - TPO

Several considerations will determine viability of plastic repair procedure(s):

- Is the damage cosmetic or structural?
- Can the repair be carried out on the vehicle?
- Is the part readily available?
- Is component repair the most cost effective method?
- Can the component be economically restored to original strength and appearance?
- Will the repair provide for the fastest, highest quality repair?

Several types of plastic are in use for automotive application. However, all plastics will fall into 2 primary categories of thermoplastic or thermosetting plastic.

**Thermosetting Plastic**

Generally, thermosetting plastics are made with 2-part thermosetting resins. When mixed together, heat is generated, producing a cure that is irreversible. Because of this, thermosetting plastics will require the use of a 2-part adhesive for repair.

**Sheet-Molded Compound**

Sheet-Molded Composite (SMC) is a type of thermosetting plastic that uses glass fibers or nylon fibers in combination with thermosetting polyester resins. When fully cured, SMC is strong and rigid.

SMC is similar to, but not identical to fiberglass. Ford Motor Company uses SMC in components such as fenders, hoods and liftgates.

### **Thermoplastic Compounds**

Thermoplastic compounds are manufactured by a process that is reversible. Thermoplastics can be remolded repeatedly by reheating. This characteristic of thermoplastics makes plastic welding a possible repair alternative. A repair of thermoplastic compounds is still possible through the use of 2-part adhesive and filler repair materials and reinforcements as needed. Thermoplastics are widely used in interior trim components, wheel flares, body side cladding and bumper covers.

### **Polyolefin**

Polyolefins fall into the family of thermoplastics with one unique characteristic: an oily or waxy feel to the material when sanded or ground. Polyolefin lends itself very well to remolding through the use of heat. Because of this, components made of this material lend themselves well to the possibility of plastic welding. Most adhesive repair materials and paint will not bond to the surface of a polyolefin unless an adhesion promoter specially formulated for plastic is first applied to the exposed raw surface. Otherwise, polyolefins are repaired like most other thermoplastics. Some typical uses of polyolefins are bumper covers, fan shrouds and wheel housings.

Correct identification of the various types of plastic is necessary to select the appropriate repair method(s) to carry out high quality plastic repairs. For information, refer to Plastics Identification in this section.

---

---

**Adhesives**

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**Material**

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Metal Bonding Adhesive TA-1	-
Plastic Bonding Adhesive TA-9	-
Seam Sealer TA-2	-
Trim and Weatherstrip Adhesive TA-14-A	-

Adhesives are used in a variety of applications. Typical uses for adhesives include roof panels, door skins and quarter panels. Trim applications include body side mouldings, emblems, stationary glass and weatherstripping. Combination sealer/adhesives are also used. Surface preparation is critical to a high quality repair. Following the label instructions for the product is essential.

Work in a well-ventilated area and protect adjacent surfaces when working with adhesives. The use of eye protection and protective clothing is also recommended when working with adhesives. Carry out a trial fit, mark and align the surfaces before bonding the materials together.

Seam sealers and corrosion protection may be necessary once the adhesive(s) has cured, depending on the application. The following is a list of adhesives recommended for certain types of applications:

- Metal Bonding Adhesive - For bonding cold-rolled steel, galvanized steel, aluminum and correctly prepared E-coat. It is used for door skin and roof panel replacement and OEM structural adhesive replacement.
  - Plastic Bonding Adhesive - For bonding a variety of plastics to plastics and plastics to primed, painted or E-coated metals. Also for general purpose bonding of trim components.
  - Seam Sealer - Heavy-bodied, non-sag adhesive/sealer for use on: standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans.
  - Trim and Weatherstrip Adhesive - For use on body side moulding, emblems, trim, bumper impact strips and carpeting.
  - Clear Silicone Rubber - Used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.
-

---

## Sound Deadeners and Insulators

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**NOTICE:** Mastic is made of a combustible material and should be removed prior to carrying out welding procedures to the area. Heat zones from welding near the mastic may cause the mastic material to burn.

**NOTICE:** Corrosion protection must be restored to the area **AFTER** the mastic material is applied. Corrosion protection products may be wax based and loss of adhesion may occur.

**NOTE:** To restore the vehicle to design intent, missing or damaged sound deadeners and insulators should be installed with the correct service replacement component.

**NOTE:** The following illustration serves as a reference to indicate mastic patch (butyl pad) locations. Additional insulators and sound deadeners are used beyond those indicated in the illustration.

1. Whenever replacement of an existing mastic insulator is carried out, the surface must be thoroughly cleaned to make sure correct adhesion will occur. The surface should be 10°C (50°F) or greater before applying the mastic. The use of a heat gun to warm the metal surface will aid in adhesion.
-

**Standard Wheelbase**

**⚠ WARNING:** If equipped with fire suppression system, refer to Section 100-02B for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** On vehicles equipped with Safety Canopy® options, prior to carrying out any sectioning repairs near the roof line or sail panel areas of the vehicle, remove the Safety Canopy® module and related components. Failure to comply may result in accidental deployment or damage to

the Safety Canopy®. Refer to **Section 501-20B**. Failure to follow these instructions may result in serious injury to technician or vehicle occupant(s).

**⚠ WARNING:** Do not carry out body side sectioning repairs in areas of door hinge or striker anchoring points. Welding within 50 mm (1.96 in) of door hinge or striker locations may compromise structural integrity during a collision. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

### Long Wheelbase

Item	Part Number	Description
1	27C91 LH/ 27C90 RH	Quarter panel upper rear extension
2	27C91 LH/ 27C90 RH	Quarter panel lower rear extension

**⚠ WARNING:** Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

**NOTE:** Factory spot welds may be substituted with either Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

**NOTE:** Observe prescribed welding procedures when carrying out any body side section repair. For additional information, refer to Welding Precautions - Steel in this section.

**NOTE:** When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

1. Drill out the spot welds of the damaged panel to be sectioned. Using a cut-off wheel, reciprocating saw or plasma cutter, cut through the damaged area of the outer panel only and remove the section to be replaced. Clean metal surfaces with metal surface prep or equivalent prior to welding.
  2. Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.
    - Make sure horizontal joints and flanges are correctly sealed with seam sealer to prevent moisture intrusion. Water and moisture migrate to horizontal joints and corrosion tends to occur more rapidly in these areas. Metal surfaces must be clean and dry before applying seam sealer.
  3. When welding overlapping surfaces or substrates, apply a weld-through primer between the surfaces prior to welding.
  4. If equipped with air suspension, reactivate the power supply. This can be accomplished by reconnecting the battery or turning on the air suspension service switch located in the luggage compartment on the LH side.
  5. Proceed with the refinish process following Ford-approved paint guidelines. Apply corrosion protection materials as required to the repair area.
-

**Restoring Corrosion Protection Following Repair**

## Special Tool(s)

 ST3049-A	Rust Inhibitor Installation Kit 286-00002
 ST3048-A	Undercoating Spray Gun 286-00001

## Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Premium Undercoating ValuGard™ VG101, VG101A (aerosol)	-
Rust Inhibitor ValuGard™ VG104, VG104A (aerosol)	-

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**NOTICE:** Drilling access holes in body panels is not recommended. Drilling holes will break the original paint finish and promote corrosion.

**NOTE:** Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are made.

**NOTE:** Refer to product label for preparation and handling instructions.

1. The surfaces must be free of oil, dirt and other foreign material. Carry out the process in the following sequence.
  1. Thoroughly clean and degrease metal surfaces using metal surface prep to remove wax and grease.
  2. For best results, the vehicle should be at room temperature. Attach the rust inhibitor canister to the Rust Inhibitor Installation Kit 286-00002.
  3. Rust inhibitor should be applied after the welding and refinishing process. Product cannot be welded through.
  4. Air pressure setting for applicator gun is 448-517 kPa (65-75 psi).

- ◆ Use the long wand when spraying enclosed areas. The spray nozzle provides a 360-degree spray pattern. Insert the wand as far as possible into the access hole, pull the trigger and wait 2-3 seconds and slowly pull the wand out of the access hole.
  - ◆ The short, hook-shaped wand sprays in one direction and must be rotated to provide complete coverage.
  - ◆ Apply the material in light mist coats.
  - ◆ Material displaces moisture.
5. Clean up any overspray with a mild solvent such as mineral spirits or bug and tar remover.

**NOTE:** The following illustrations provide typical applications of body seams and spot welded flanges and are not vehicle specific.

2. **NOTE:** Door assembly lower view.

Apply rust inhibitor as shown to the inside of the door shell on all the interior metal surfaces using the most suitable applicator wand. Apply material to the exposed edges after carrying out the welding process. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion. Keep door drain holes clear to prevent moisture buildup.

3. **NOTE:** Quarter panel inner view.

Apply rust inhibitor to the closed channel portion of the spot weld flange areas using the short, hook-shaped wand. Apply material to the exposed edges after carrying out the welding process. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

4. **NOTE:** Door frame opening view.

Apply rust inhibitor to the closed channel portion of the spot weld flange areas using the short, hook-shaped wand. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

### Body and Frame Undercoating

1. **⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**NOTICE:** Do not allow undercoating on powertrain components. Failure to follow these instructions may result in incorrect operation of these components.

**NOTE:** Refer to product label for preparation and handling instructions.

**NOTE:** Avoid high-pressure water spray cleaning to treated underbody area for 24 hours.

Wire brush the area and make sure the surfaces are free of oil, dirt and other foreign material. Carry out the undercoating process in the following sequence.

1. Thoroughly clean and degrease metal surfaces using metal surface prep to remove wax and grease.
2. For best results, the vehicle should be at room temperature.
  - ◆ Canister attaches directly to the dispensing gun. Attach the undercoating canister to the Undercoating Spray Gun 286-00001.
3. Undercoat should be applied after the welding and refinishing process. Product cannot be welded through.
4. Air pressure setting for applicator gun is 552-621 kPa (80-90 psi).
  - ◆ Apply light mist coats, applicator sprays in fogging pattern.
  - ◆ Material displaces moisture.
5. Clean up any overspray with a mild solvent such as mineral spirits or bug and tar remover.

**NOTE:** The following illustrations provide typical applications to frame rails and are not vehicle specific.

2. **NOTE:** Frame rail exterior spot-weld flange view.

Apply undercoat material to the exterior exposed edges after carrying out the welding and refinishing process.

3. **NOTE:** Cross section view of typical unibody frame rail shown.

Apply rust inhibitor to the inner surfaces of the rail after carrying out welding process. Use the long wand and insert as far as possible, depress trigger and wait 2-3 seconds and slowly pull the wand to make sure the area is completely fogged.

4. **NOTE:** Full frame vehicle, front rail-to-mid rail section repair shown.

Apply undercoat material to the exposed surfaces after carrying out the welding process. Make sure to completely cover any bare metal areas.

---

**Refinishing - Environmental Damage**

## Material

Item	Specification
Motorcraft® Acid Neutralizer ZC-1-A	-
Motorcraft® Alkaline Neutralizer ZC-2-A	-
3MTM Perfect-It™ Show Car Liquid Wax 39026	-
Motorcraft® Detail Wash ZC-3-A	-

**Iron Oxide (Rail Dust) or Acid Rain Decontamination**

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**NOTICE:** In extreme cases of contamination, the vehicle may require refinishing. To avoid paint failure, follow the appropriate decontamination procedure prior to carrying out any panel refinishing procedure.

**NOTE:** Iron oxide contamination appears as tiny rust spots on horizontal surfaces and in severe cases can be felt. This damage is typically caused from rail shipment, storage near railroad tracks or fallout from industrial manufacturing facilities.

**NOTE:** Acid rain contamination can be identified as water spotting and, in severe cases, staining within the water spots.

1. **NOTICE:** Never paint over iron particles as rust spots will reoccur. Use only the recommended decontamination procedure detailed below.

Rinse any dust, dirt and foreign material from the vehicle body with cold water. Flush liberally.

2. Prepare the acid neutralizer by mixing 8 parts of water to 1 part neutralizer in a bucket.
3. **NOTICE:** To avoid paint failure, do not allow the product to dry on the vehicle.

**NOTE:** Use a separate wash mitt for each product applied to the vehicle.

Working quickly and beginning at the top of the vehicle and working to the sides, apply the acid neutralizer mix to the entire vehicle. Keep the vehicle wet with the solution and lightly agitate for 5 to 7 minutes. Continue around the vehicle 4 to 5 times. For severe conditions, work the product for up to 8 minutes.

4. Rinse the vehicle completely with cold water to remove the product.
5. Dry only the horizontal surfaces of the vehicle, do not dry the glass at this time.
6. **NOTICE: To avoid damage to the paint surface, do not apply the alkaline neutralizer directly to the vehicle plastic trim.**

**NOTE:** Use a separate wash mitt for each product applied to the vehicle.

**NOTE:** Alkaline neutralizer is a ready-to-use product. Do not mix with water.

Pour the alkaline neutralizer into a squirt bottle and apply the solution to a clean wash mitt.

7. **NOTICE: To avoid paint failure, do not allow the alkaline neutralizer to dry on the vehicle.**

Apply the product to the vehicle keeping the solution wet and lightly agitate for 5 to 7 minutes. For severe conditions, work the product for up to 8 minutes.

8. Rinse the vehicle completely with cold water to remove the product.
9. Prepare the detail wash by mixing 29.5 ml (1 oz) with 3.78L (1 gal) of water.
10. Using a clean wash mitt, shampoo the entire vehicle and rinse with cold water. Dry the vehicle completely.
11. Visually inspect the paint surface for any remaining evidence of ferrous metal particles. Repeat procedure as necessary.

### Surface Finishing Following Decontamination

1. **NOTICE: When attempting to affect a repair by buffing, polishing or color sanding, do not remove an excess of 0.3 mil of paint film or refinishing will be required.**

**NOTE:** Acid rain discoloring or etching may require color sanding in addition to buffing and polishing. In extreme cases, refinishing may be required if the following procedure does not restore the vehicle finish.

**NOTE:** Do not intermix buffing products. Use only one manufacturer's product.

**NOTE:** Always follow the manufacturer's product usage sequence. Use the appropriate buffing or polishing pad at the recommended buffing speed as specified by the product manufacturer.

Apply rubbing compound to the vehicle surface as recommended by the product manufacturer.

2. Apply machine glaze to the vehicle surface as recommended by the product manufacturer.
3. Use an alcohol and water mixture (1 to 1) to clean the buffed and polished areas. Verify removal of scratches and swirls before the application of the final polish.

4. Apply a final polish material by hand, with a dual-action sander and foam pad, or with an orbital polisher and appropriate polishing bonnet.
  5. Wash and dry the vehicle.
-

---

**Refinishing - Manufacturing Damage**

## Material

Item	Specification
3MTM Perfect-It™ Show Car Liquid Wax 39026	-
Motorcraft® Detail Wash ZC-3-A	-

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**NOTICE:** To avoid overspray damage to adjacent panels, protect adjacent areas/substrates when preparing for and during refinishing.

**NOTE:** Peeling/delamination concerns can be described as lack of adhesion, either between the substrate and topcoats or between individual coats of paint.

1. Wash the repair area with detail wash or pH-neutral soap and water.
2. Remove any trim, emblems and hardware from the area to be repaired.
3. **NOTE:** All delamination must be removed.

Sand or media blast the damaged surface, keeping the repair area as minimal as possible.

4. Treat any bare metal surface to prevent flash corrosion, and prime and block sand as necessary prior to refinishing.
  5. Mask the adjacent panels to protect from overspray.
  6. Spot repair the base coat as necessary, following the paint manufacturer's prescribed procedures.
  7. Following the paint manufacturer's prescribed procedure, apply clear coat to the entire panel.
-

**Plastics Identification**

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**NOTE:** Identification of the various plastic types is necessary to select the appropriate repair methods to make high quality plastic repairs. Plastics can generally be broken down into 2 categories, thermoplastics and thermosetting plastics. Thermoplastics can be remolded by heating. This makes plastic welding a possible repair alternative.

1. **NOTE:** In some instances, a code or material designation is stamped indicating the plastic type.

Thermoplastics are solvent reactive. Types of thermoplastics include Thermoplastic Olefin (TPO), Polyvinyl Chloride (PVC) and Acrylonitrile Butadiene Styrene (ABS). Polyolefins have an oily or waxy appearance. Examples include some bumper covers, stone shields, fender aprons and fan shrouds. Polyolefins require an adhesion promoter prior to carrying out any refinish procedure.

- To determine if the part is a polyolefin, grind the damaged area in an out-of-sight area. Grinding a polyolefin will melt and smear the plastic and leave a ragged edge. If the part is non-polyolefin, the area will grind or sand smoothly, producing a powdery dust.

**Rigid Plastic Parts**

Code	Family Name	Common Trade Name	Typical Application
ABS	Acrylonitrile Butadiene Styrene	ABS, Cicolac, Lustran, Kralistic	A-Pillars, Consoles, Grilles
SMC	Sheet Molded Composite	SMC	Body Panels

**Flexible Plastic Parts**

Code	Family Name	Common Trade Name	Typical Application
RRIM	Reinforced Reaction Injection-Mold Material PUR	RRIM	Fascias, Body Panels, Body Trims
TPO	Thermoplastic Polyolefin	Polytrope, Renflex, Santropren Telcar, Vistaflex, ETA, Apex, TPO	Bumpers, End Caps, Rubber Strips, Sight Shields, Claddings, Interior B-Post

2. Polyolefin plastic can also be identified by placing a small sliver in a container of water, if the sample floats, it is a polyolefin plastic. A non-polyolefin will sink when placed in a container of water.
3. Generally, thermosetting plastics are rigid or semi-rigid. Sheet-Molded Composite (SMC) is reinforced with glass and other fibers and are strong and rigid. SMC is used for large panels such as hoods, liftgates, fenders and quarter panels.
  - A burn test can be a reliable method to determine if a plastic is a thermosetting plastic. Extreme care must be exercised when using this method.
    - ◆ **NOTICE: The component must be isolated away from the vehicle and all combustible materials to perform this test.**

Apply an open flame to the corner of the damaged component. If the material crystallizes and becomes hard, it is a thermosetting plastic.

---

---

## Plastics Refinishing

### All Components

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Do not paint any air bag module trim covers or deployment doors. Paint may cause the air bag to deploy incorrectly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

**NOTE:** When using any Ford-approved refinishing product, it is recommended to stay within the same paint system throughout the process. For example, do not use one manufacturer's primers and another manufacturer's topcoats.

1. **NOTE:** Care must be used if applying heat to parts. Thermoplastics soften and tend to lose their shape when heated.

The first step for any repair or refinish procedure is to identify the type of plastic. Is it thermosetting or thermoplastic, grained or smooth? This will determine how it should be cleaned and prepared for refinishing. For additional information, refer to Plastics Identification in this section.

- It is essential that the correct cleaner is used, depending on which painting system is employed, solvent-based or water-based.
  - Clean part with warm water/mild detergent, then with plastic cleaner to remove wax, silicone and other contaminants. Do not allow parts to remain wet for extended periods.
  - As a general rule, if water beads on the part, it requires additional cleaning as all the manufacturing release agents have not been removed.
2. New parts may require baking in a spray booth or heating with heat lamps to release trapped solvents or mold release agents used in the manufacturing processes.

### Non-grained components

3. After cleaning, lightly sand with 600-grit or finer sandpaper. Remove sanding residue with plastic cleaner and wipe dry.

### Grained components

4. After cleaning, light use of a gray scuff pad is permissible providing the graining not be flattened. Remove sanding residue with plastic cleaner and wipe dry.

### All components

5. Apply a plastics adhesion promoter to any bare plastic part following manufacturer's recommendation. Throughout the refinish procedure, any time bare plastic is exposed for any reason, it is essential that adhesion promoter be reapplied to that area.
6. A sealer may be required to prevent wrinkling and lifting of the topcoat prior to carrying out the refinish procedure.

7. Flexible and non-flexible components should be refinished separately as a flex additive may be required when refinishing flexible parts (refer to the paint manufacturer's recommendation).
  8. It is recommended to carry out refinishing of exterior components on-vehicle (after cut-in) to control color match and blending to adjacent panels.
  9. Proceed with the refinish process and follow the Ford-approved paint system procedures. Steps may vary between paint manufacturers.

**Weld-Bonding**

## General Equipment

3 Phase Inverter Spot Welder 254-00002
Compuspot 700F Welder 190-50080
I4 Inverter Spot Welder 254-00014
Inverter Welder with MIG Welder 254-00015

## Material

Item	Specification
Metal Bonding Adhesive TA-1	-
Motorcraft® Metal Surface Prep ZC-31-A	-
Rust Inhibitor ValuGard™ VG104, VG104A (aerosol)	-
Seam Sealer TA-2	-

**Weld-Bonding - Squeeze-Type Resistance Spot Welding (STRW) Method**

**⚠ WARNING:** Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious

**personal injury to vehicle occupants in a crash.**

**NOTE:** On door shells that are manufactured with structural adhesives only, weld bonding door skins is not recommended. Only metal bonding adhesive should be used.

**NOTE:** Weld-bonding is a method used to join metals using Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) welding and structural adhesive. The steps listed in this procedure apply to both types of welding. STRW is the preferred method. MIG welding should only be used when areas to be welded cannot be accessed using STRW -type machinery.

**NOTE:** Factory spot welds should be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Verify the vehicle is dimensionally correct on a frame machine. Straighten if necessary.
2. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.
3. Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.
4. Prepare any damaged flanges on the vehicle using hammer and dolly.
5. Grind the mating surface of the original flanges no greater than 25 mm (0.98 in) where the metal bonding adhesive will be applied.
  - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.
  - Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed. Clean surfaces with metal surface prep or equivalent.
6. Dry-fit and clamp the replacement service parts to verify a correct fit.
  - Remove the service part after verifying correct fit and alignment.
7. **NOTE:** The ends of welding clamps should be insulated on the ends using tape or similar material when welding is carried out.

Follow manufacturer's prescribed welding procedures and settings. For additional information, refer to Welding Precautions - Steel in this section.

8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of a correct mix ratio.
9. **NOTE:** Welding can be carried out anytime during the adhesive curing process, or after the adhesive is fully cured. Welder settings will vary when welding through wet adhesive versus welding through fully cured adhesive. Refer to welder manufacturer's recommended settings for welding through fully cured adhesive. It is recommended to place a shunt weld in an area with no adhesive to make sure of conductivity, particularly when welding through fully cured adhesive.

**NOTE:** Refer to the product label for handling and preparation instructions.

Create a test sample.

1. Prepare the metal and adhesive as described. Apply a 6-9 mm (0.23-0.35 in) bead of adhesive and weld the sample.
  2. Place the welded sample in a vice and carry out destructive weld tests by peeling the scrap metal apart using large lock-type pliers. Measure the weld nugget to determine that the nugget meets Ford weld nugget requirements. If the weld nugget does not meet required size, adjust welder settings until the correct weld nugget size is achieved.
  3. When the correct weld nugget size is achieved, the service part can be weld-bonded. For additional information, refer to the weld nugget table in Specifications in this section.
- 
10. Apply a 6-9 mm (0.23-0.35 in) bead of metal bonding adhesive to the vehicle prepared flange surface.
  11. Place the service part(s) in the correct position on the vehicle.
    - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.
  12. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.
  13. **NOTE:** Refer to product label for cure times and handling instructions. Clamps may be removed immediately after the component is welded.
- Wipe excess adhesive from the panel before it cures.
14. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, apply conventional body filler after the adhesive cures and block-sand the area.
  15. Use seam sealer wherever a cosmetic seam sealer is required.
  16. Mix and apply primer surfacer per Ford-approved paint recommendations.
  17. Mix and apply basecoat per Ford-approved paint recommendations.
  18. Mix and apply clearcoat per Ford-approved paint recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.
  19. Apply anti-corrosion treatment to the repair area as required. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

### **Weld-Bonding - Metal Inert Gas (MIG) Welding Method**

**⚠ WARNING:** Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

**⚠ WARNING:** Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct

**density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.**

**⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

**⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

**NOTE:** Metal Inert Gas (MIG) weld-bonding can be substituted as an alternative to Squeeze-Type Resistance Spot Welding (STRW). It may only be used to weld areas that are inaccessible to STRW machinery. However, when accessible, STRW is the preferred method.

**NOTE:** On door shells that are manufactured with structural adhesives only, weld-bonding door skins is not recommended. Only metal bonding adhesive should be used.

**NOTE:** Factory spot welds should be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.
  - Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.
2. After removing the damaged sheet metal panel(s), repair any damaged flanges on the vehicle using a hammer and dolly.
3. Using an appropriate grinder, carefully grind around the entire receiving flange area following the original welds. Be sure to remove all E-coat, paint or galvanized coating from the mating surfaces of the joint.
  - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.
  - Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed. Clean the surface with metal surface prep or equivalent.
4. Repeat the procedure from Step 3 on the mating surface of the replacement service part(s).
5. Prepare the new service panel for plug welds.
  - Using the original panel as a reference, drill or punch 8 mm (0.31 in) diameter holes in the exact number as the original spot welds. The holes should be positioned as close as possible to the original spot weld locations, without lining up exactly on top of an original spot weld site.
  - To make sure of correct weld performance, grind the immediate perimeter of the plug weld hole. Grind only in the area of the plug weld; this will keep corrosion to a minimum.
6. Dry-fit and clamp the replacement service parts to verify a correct fit and alignment.
  - Remove the service part after verifying correct fit and alignment.
7. The vehicle prepared flange areas where plug welds will be located must be kept free of adhesive.

Apply 25 mm (0.98 in) tape to the plug weld areas to prevent contamination from the adhesive.

8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of correct mix ratio.

9. **NOTE:** Refer to product label for cure times and handling instructions.

Apply a 6-9 mm (0.23-0.35 in) bead of adhesive to the vehicle prepared flange surface. Remove the tape from the plug weld areas.

10. Place the service part(s) in the correct position on the vehicle.
  - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.
11. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.
12. **NOTE:** Welding can be carried out anytime during the adhesive curing process or after the adhesive is fully cured.

**NOTE:** If welding will not be carried out immediately, refer to product label for cure times and handling instructions. Clamps may be removed immediately after the component is welded.

Wipe excess adhesive from the panel before it cures.

13. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, apply conventional body filler after the adhesive cures and block-sand the area.
  14. Use seam sealer wherever a cosmetic seam sealer is required.
  15. Mix and apply primer surfacer per Ford-approved paint recommendations.
  16. Mix and apply basecoat per Ford-approved paint recommendations.
  17. Mix and apply clearcoat per Ford-approved paint recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.
  18. Apply anti-corrosion treatment to the repair area as required. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.
-

**Plastics Repair**

## Material

Item	Specification
Plastic Bonding Adhesive TA-9	-

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

1. In deciding whether to repair or install a new component, follow these guidelines.
  - Is a part readily available?
  - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
  - Will repair provide for the fastest, highest quality repair?
2. **NOTICE:** Never apply solvents such as lacquer thinner or reducer at any stage of plastic repair. Solvents, cleaners and water are absorbed by many types of plastics and by the glass fibers used for reinforcements. If this occurs, the plastic may swell in the area of repair and cause the repair to fail. Remove cleaners and water quickly and use air and heat to speed up drying.

**NOTICE:** During the repair of many plastics and particularly polyolefin plastics, an adhesion promoter must be applied to the substrate to allow repair materials and paint to bond correctly. Reapplication is required when grinding or sanding through the sealer or primed layers.

**NOTE:** When possible, it is recommended to carry out as much of the plastic repair as possible on the vehicle. Parts mounted on the vehicle are held in correct alignment throughout the repair. Attempting to repair the part off the vehicle may cause misalignment. This could lead to failure of the repair.

Select the correct repair method by identifying the type of plastic being repaired. For additional information, refer to Plastics Identification in this section to determine the type of plastic being repaired.

3. **NOTE:** Always refer to the manufacturer's label directions for the type of repair materials, fillers and bonding agents being used as they are material specific.

Determine whether a reinforcement piece is needed as a backer on large repairs.

- Construct a reinforcement piece from a scrap piece of the type of plastic being repaired and follow manufacturer's label directions for the type of system being used.
- When repairing Sheet-Molded Composite (SMC), a reinforcement piece can be constructed using several layers of glass cloth saturated with resin or structural adhesive. The weave of the cloth or screening should be loose enough to allow the resin to thoroughly penetrate. Reinforcement should cover the entire area of damage and extend outward beyond the

damage or joint area.

### Sheet-Molded Composite (SMC) Panel Repair

**NOTE:** The following procedure applies to repair of structural cracks and large gouges. If damage is cosmetic, use of reinforcing cloth may not be necessary.

1. Panels to be repaired should be dry and at room temperature 18°C (65°F) to 24°C (75°F) prior to carrying out any repairs. Both sides of the panel must be thoroughly cleaned before sanding or grinding.
2. Cover the break in the SMC (front and back) with masking tape. This protects the damaged area from absorbing the prep cleaner and eliminates wicking of the cleaner through the fibers into the SMC .
3. Remove all waxes, silicones, dirt and road oils from the area surrounding both sides of the damaged area with a plastics wax and grease remover.
  - Remove the tape and sand the back of the repair area with an angle grinder, Dual Action (D/A) sander or by hand using 80-grit sandpaper. Remove all dust with a vacuum and tack cloth.
4. Create a reinforcing patch using a piece of scrap SMC that conforms well to the back of the damaged area or form a patch from fiberglass cloth.
  - Cut a section of cloth large enough to cover the repair, plus 25.4 mm (1 in) around the repair area.
  - Cut a section of plastic film backing approximately 25.4 mm (1 in) larger than the cloth. Lay the plastic on a smooth, flat surface where it will be used to create a pyramid patch.
5. Follow manufacturer's directions and apply plastic repair adhesive to the plastic film backing and smooth with plastic spreader to recommended thickness. Place the pre-cut fiberglass cloth on the adhesive-coated plastic film. Cover the cloth with a coat of repair adhesive and spread to the recommended thickness.
6. Apply the prepared patch to the backside of the panel and compress. Follow manufacturer's instructions for adhesive cure. Remove plastic film after adhesive cures and sand as necessary to remove roughness.
7. Remove masking tape from the front side of damaged area and grind down to the backing patch. Use an angle grinder with a 30- to 40-grit wheel. Make a gradual taper in the area, this will prevent bull's-eyes or read-through in the finished repair. Sand prepared area with a D/A sander or hand-sand with 80-grit sandpaper.
8. Build a pyramid patch using fiberglass cloth or equivalent and plastic repair adhesive. Following manufacturer's directions, apply patch to damaged area.
9. Rough-grind area to remove excess adhesive. Sand repair area with 80-grit sandpaper, making sure to cut slightly below the SMC finished surface. This will allow for a finish coat of plastic body repair material.
10. Apply a finish coat of plastic repair filler material per manufacturer's directions.
11. Finish-sand, prime and topcoat using Ford-approved paint systems.

## Thermoplastic Compounds

1. In deciding whether to repair or install a new component, follow these guidelines.
  - Is a part readily available?
  - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
  - Will repair provide for the fastest, highest quality repair?
2. **NOTE:** The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.

Thoroughly clean the damaged area with wax and grease remover formulated for use with plastics.
3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.
4. Apply a plastics adhesion promoter per label directions to the repair area.
5. For small repairs, a plastic adhesive filler can be applied to the damaged area. Follow manufacturer's directions and build layers to form a thickness above the damaged area. This will allow the area to be sanded smooth.
6. To repair large holes or cracks, measure and cut a piece of fiberglass cloth or equivalent 25.4 mm (1 in) larger than the crack or hole.
  - Apply plastic repair adhesive to the damaged area and immediately apply fiberglass cloth into plastic adhesive for reinforcement. Apply additional plastic repair adhesive for strength and shape as required.
7. Contour and shape the repair as necessary with a D/A sander. Avoid sanding through the repair.
8. Finish-sand the area and carry out any required paint operations using Ford-approved paint systems.

## Tab Repair - Bumper

1. **NOTE:** Inspect the bumper cover to determine if part of it can be repaired to an acceptable level of quality of appearance, fit and durability. Will labor and material cost of the repair meet or exceed the cost of a new replacement bumper cover? If the bumper cover is determined to be repairable, proceed to the following steps.

**NOTE:** The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.

Remove the affected bumper. For additional information, refer to Section 501-19 .

**NOTE:** Illustration is not vehicle specific.

2. Clean the broken tab(s) with a plastics wax and grease remover.

3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.
  4. Apply a plastics adhesion promoter per label directions to the repair area.
  5. Measure and cut a patch of fiberglass cloth or equivalent large enough to form the front of the tab, then slope back in a wedge shape approximately 51 mm (2 in) from original tab.
  6. Prepare the repair adhesive cloth patch per manufacturer's instructions and apply to the affected area.
    - Immediately position the plastic repair material patch to form the tab shape.
  7. Allow appropriate cure time and shape the repair tab using a small angle sander. Use extreme care to not sand through the exterior surface.
  8. Carry out any required paint repair operations to the bumper cover using Ford-approved paint systems.
  9. Reassemble and install the bumper cover. For additional information, refer to Section 501-19.
-

**Frame Members**

## General Equipment

3 Phase Inverter Spot Welder 254-00002
Compuspot 700F Welder 190-50080
I4 Inverter Spot Welder 254-00014
Inverter Welder with MIG Welder 254-00015
Weld Wire ER70S-3 or equivalent 0.9-1.1 mm (0.035-0.045 in)

**Front Frame Rail Service Kit**

Item	Part Number	Description
1	5D059 LH/ 5D058 RH	Frame rail replacement kit

**Frame Front Crossmember**

Item	Part Number	Description
1	5020	Frame crossmember

**NOTE:** Viewed from bottom.

Item	Description
1	No. 1 crossmember
2	Master locator hole A1
3	Master locator hole A3 (located on side)
4	Master locator hole C
5	Master locator hole A4 (located on side)
6	Master locator hole A2
7	No. 2 crossmember front mounting hole
8	Master locator hole B

**⚠ WARNING:** Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

**⚠ WARNING:** Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal

injury.

**⚠ WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

**NOTICE:** The following applies only to non-fire suppression equipped vehicles. Fire suppression equipped vehicles require the entire frame be replaced. Failure to follow this direction will compromise system operation.

**NOTICE:** The following steps provide the procedure for replacing the front frame rails. The frame is designed with energy absorbing convolutions in the front frame rails to absorb crash energy. This convolute section of the frame **MUST NOT** be straightened if the convoluted surfaces show evidence of collapse or buckling. Additionally, if any evidence of damage exists behind the No. 2 crossmember (buckling, cracking), then the entire frame must be replaced.

**NOTE:** Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

**NOTE:** The replacement front rail will be cut and welded to the existing frame using a sleeved butt joint. The sleeve will be made from the unused portion of the service replacement rails.

1. **NOTE:** All body alignment measurements are carried out with the vehicle trim removed. Measurements are made metal to metal, on center unless otherwise specified.

Measure the vehicle to determine if the body requires straightening and alignment. For body dimensional information, refer to Body in this section.

- Anchor the vehicle to a frame rack following the manufacturer's instructions.
2. Remove the front bumper. For additional information, refer to Section 501-19.
  3. Remove the radiator. For additional information, refer to Section 303-03.
    - Drill out spot welds that attach the radiator support, as required, and remove the radiator support.
  4. Remove the engine. For additional information, refer to Section 303-01.
  5. Remove the suspension components. For additional information, refer to Section 204-01.
  6. Using a plasma cutter, reciprocating saw or cut-off wheel, remove the No. 1 crossmember as necessary.

7. Remove the No. 2 crossmember.

8. Measure in a straight line the diagonal distance from the center of master locator hole A1 (2), to the No. 2 crossmember front mounting hole (7), and record. Repeat for master locator hole A2 (6), to the No. 2 crossmember front mounting hole on the opposite side. The difference in these distances must not exceed 6 mm (0.23 in). If the difference is greater than 6 mm (0.23 in), the entire frame must be replaced.

9. **NOTE:** Observe prescribed welding procedures when carrying out frame rail service kit replacement. For additional information, refer to Welding Precautions - Steel in this section.

Using a plasma cutter, reciprocating saw or cut-off wheel, cut off the damaged front rail section at cut line (1). Do not cut directly along the scribed line. Leave enough material on the front side of the scribe line to allow the edge to be ground exactly to the line. This is necessary to make sure of correct fit up between the frame and replacement rail section.

1. Scribe a vertical cut line 60 mm (2.36 in) in front of the No. 2 crossmember locating hole.
2. No. 2 crossmember locating hole.

10. Grind off the excess damaged frame in front of the scribed line on the existing rails.
  - Grind a 45 degree bevel along the edge of the existing rail.
11. Drill four 10 mm (0.39 in) holes in the damaged frame, top and bottom surfaces, to aid future plug welding of the inner reinforcement sleeve. Hole locations are 20 mm (0.78 in) to the rear of the cut line and 30 mm (1.18 in) from the edge of the frame rail.

12. Drill four 10 mm (0.39 in) holes in the damaged frame, inner and outer surfaces, to aid plug welding of the inner reinforcement sleeve. Hole locations are 20 mm (0.78 in) to the rear of the cut line and 45 mm (1.77 in) from the top and bottom surfaces.

13. Remove the E-coat from the edges, including around the holes to be welded, by grinding or sanding the frame until bare metal is visible.

- Wire brush any foreign material from the frame edges within 15 mm (0.59 in) of the repair joint.

14. To prepare for installation, the service part rail will be cut between cut lines 1 and 3. Scribe cut lines 1, 2 and 3 (cut line 2 will be used later in the procedure to make the reinforcement sleeve).

1. Cut line 1 is 55 mm (2.16 in) in front of the center of the No. 2 crossmember locating hole.
2. Cut line 2 is 10 mm (0.39 in) rearward of the No. 2 crossmember locating hole.
3. Cut line 3 is 65 mm (2.55 in) in front of the center of the No. 2 crossmember locating hole.

15. Drill four 10 mm (0.39 in) holes in the service replacement frame, top and bottom surfaces, to aid future plug welding of the inner reinforcement sleeve. Hole locations are 15 mm (0.59 in) forward of cut line 3 (previously scribed), and 27 mm (1.06 in) and 30 mm (1.18 in) from the edge of the frame rail.

16. Drill four 10 mm (0.39 in) holes in the service replacement frame, inner and outer surfaces, to aid future plug welding of the inner reinforcement sleeve. Hole locations are 15 mm (0.59 in) forward of cut line 3, and 45 mm (1.77 in) from the top and bottom surfaces.

17. Using a reciprocating saw, plasma cutter or cut-off wheel, cut the service part rail at cut line 3. Do not cut directly along the scribe line: cut between lines 1 and 3 leaving enough material on the rear side of line 3 to allow the edge to be ground exactly to the line. This is necessary to make sure of correct fit up between the frame and the replacement rail section.

1. Cut line 1 is 55 mm (2.16 in) in front of the center of the No. 2 crossmember locating hole.
2. Cut line 2 is 10 mm (0.39 in) rearward of the No. 2 crossmember locating hole.
3. Cut line 3 is 65 mm (2.55 in) in front of the center of the No. 2 crossmember locating hole.

18. Grind off the excess frame material to the rear of cut line 3 on the service part rail.
19. Grind a 45 degree bevel along the edge of the service part rail.
20. Remove the E-coat from the edges, including around the holes to be welded, by grinding or sanding the frame until bare metal is visible.
- Wire brush any foreign material from the frame edges within 15 mm (0.59 in) of the repair joint.
21. **NOTE:** Make note of the orientation of the sleeve (front and top) for future reference to the sleeve.

Fabricate a reinforcement sleeve from the leftover portion of the service part. Make a cut just to the rear of cut line 2. This produces a sleeve that is 70 mm (2.75 in) to 75 mm (2.95 in) long, depending on the exact location of the cut made between cut lines 1 and 3.

1. Cut line 1 is 55 mm (2.16 in) from the center of No. 2 crossmember locating hole.
2. Cut line 2 is 10 mm (0.39 in) rearward of the No. 2 crossmember locating hole. Make the cut just to the rear of the cut line.

22. Scribe 4 marks onto each face of the sleeve to aid in drawing scribe lines.
- On the sleeves outside face, measure and scribe a mark 70 mm (2.75 in) up from the bottom surface along both front and rear edges, and 70 mm (2.75 in) down from the top along both front and rear edges. Repeat for the sleeves inside face.
  - On the sleeves top face measure and scribe a mark 41.5 mm (1.63 in) out from the inside surface along both front and rear edges, 51 mm (2 in) in from the outside surface along the front edge, and 43.5 mm (1.71 in) in from the outside surface along the rear edge.

23. Connect the scribed marks to form 8 straight lines. Cut the sleeve into 4 L-shaped pieces, checking that the 4 pieces fit inside the existing frame.
24. Install the 4 pieces one at a time into the service replacement rail only. Trim the parts as needed for a flush fit against the inside surface of the rail. If installed on the existing frame first, the geometry of the frame may not allow the service replacement rail to slide over the sleeve.
25. Plug weld the sleeves into place through the 8 holes drilled previously.
  - When the sleeves are in place, check the fit and alignment of the service part rail. Insert and support the rail and the sleeve into the vehicle, leaving a 5 mm (0.19 in) gap at the butt joint when measuring the alignment.

26. Check that the No. 2 crossmember aligns with the mounting holes on the frame rails.
27. Check the position of the front body mount on both the left and right hand rails. Measure the diagonal distance from master locator hole A1 to the front body mount and record it. Repeat for master locator hole A2. This distance should be 1,689 mm (66.49 in). The difference between the 2 measurements should not exceed 6 mm (0.23 in).
  - If the measurements exceed 6 mm (0.23 in), adjust the frame rail until the No. 2 crossmember mounts correctly and the difference between the diagonal measurements is less than 6 mm (0.23 in).
28. Prepare all bare metal surfaces with metal surface prep. Apply weld-through primer to the immediate heat affected zone of the weld area.
29. Maintaining the 5 mm (0.19 in) gap at the butt joint, plug weld the replacement rail to the existing frame at the eight 10 mm (0.39 in) holes. Recheck the alignment of the frame and adjust as necessary.
30. Stitch-weld along the section joint using a Metal Inert Gas (MIG) welder with 0.9-1.1 mm (0.035-0.045 in) AWS ER70S-3 wire. Make 50 mm (1.96 in) welds on all 4 sides of the rail. Support the service replacement rail (1), and repeat the step to check the alignment of the rail.

- Complete the stitch-weld along the entire section joint. This will create a solid joint with minimal heat distortion.

31. Dress all welds as necessary.
32. Use a dye penetrant to determine if any cracks or large voids exist in the weld joint. If cracks or other defects exist, grind out the defect and repair until the weld is free of defects.
  - Clean the repair area with metal surface prep and apply corrosion protection to the inside and outside of the frame.
33. Install the No. 1 crossmember.
  - Remove the E-coat from the mating surfaces to be welded, 15 mm (0.59 in) from the edges or holes by grinding or sanding until bare metal is visible.
34. **NOTE:** Prepare all bare metal surfaces with metal surface cleaner. Apply weld-through primer to the immediate heat affected zone of the weld area.

Install the No. 1 crossmember.

1. Align the No. 1 crossmember on the frame rails. Using the master locator hole in the center of the crossmember for reference.
2. The distance between the left and right front body mount to the master locator hole is 520 mm (20.47 in) 3 mm (0.11 in).
3. Using a MIG welder, stitch-weld along the top and bottom 55 mm (2.16 in), where the No. 1 crossmember C-section meets the frame's top and bottom surface. Use 9 mm (0.35 in) AWS ER70S-3 wire.

35. Dress all welds as necessary.
36. Use a dye penetrant to determine if any cracks or large voids exist in the weld joint. If cracks or other defects exist, grind out the defect and repair until the weld is free of defects.
  - Clean the repair area with metal surface cleaner and apply anti-corrosion coating to the bare metal areas.
37. Reinstall components removed during disassembly, making sure to tighten all fasteners to correct specification.
38. If equipped with an air suspension system, activate the power supply. This can be accomplished by reconnecting the battery or turning on the air suspension service switch located in the luggage

compartment LH side.

---

**Ballistic Door Panel**

## Special Tool(s)

	<b>Heavy Duty Riveter</b> 501-D011 (D80L-23200-A) or equivalent
---	--

**Ballistic Door Panel Insert**

**NOTE:** Some Crown Victoria police package vehicles come equipped with a ballistic front door panel insert. The ballistic door panel is a 2-piece assembly. These panels are a set and cannot be serviced individually.

Item	Part Number	Description
1	420221 LH/ 420220 RH	Front door outer panel
2	143580	Protective film
3	201B69	Ballistic door panel kit (driver side)
4	201B68	Ballistic door panel kit (passenger side)
5	W712308-S439	Bolts (2 required)
6	W500214	Bolt
7	N806886	J-clips (3 required)
8	600562	Foam tape (dual layer)
9	5420125 LH/ 5420124 RH	Front door shell

**Removal**

1. Remove the front door glass top run. For additional information, refer to [Section 501-11](#) .
2. Remove the front door window regulator and motor. For additional information, refer to [Section 501-11](#) .
3. Remove the front door latch. For additional information, refer to [Section 501-14](#) .

4. Remove the bolt on the forward ballistic door panel.

5. Remove the bolt on the rearward ballistic door panel.

6. Remove the center bolt of the ballistic door panel.

7. Slide the forward ballistic door panel as far to the front as possible and remove the rearward panel.

8. Remove the forward ballistic door panel.

## Installation

1. **NOTE:** If installing ballistic door panels in a new door or on a vehicle which has received a new front door outer panel, make sure to first install the protective film. If only reinstalling the ballistic door panels, proceed to Step 4.

Install protective film to the front door outer panel belt line, position to the bottom of the belt line flange.

2. **NOTE:** If installing ballistic door panels in a new door, make sure to first install the foam tape to the intrusion beam to prevent panel rattle. If only reinstalling the ballistic door panels, proceed to Step 4.

Apply a double-layer of the foam tape to the intrusion beam.

3. Install the J-clips.
4. Insert the forward ballistic door panel through the window opening and hook the top bracket over the outer belt line sheet metal.
  - Position as far forward as possible.
5. Insert the rearward ballistic door panel through the window opening and hook the top bracket over the outer belt line sheet metal.
  - Slide the forward panel back until mated with the rearward panel.
6. Align the panels so the ceramic plate bottoms out against the adjacent panel.
7. Install the bolt in the lower L-bracket.
  - Tighten to 12 Nm (106 lb-in).

8. Install the bolt in the rearward intrusion beam bracket J-clip, but do not tighten.

9. Install the bolt in the forward intrusion beam bracket J-clip, but do not tighten.

10. Visually inspect to make sure there is no gap between the panels. Adjust as necessary.
11. Tighten the rear bolt to 12 Nm (106 lb-in).
12. Tighten the forward bolt to 12 Nm (106 lb-in).
13. Install the front door latch. For additional information, refer to [Section 501-14](#) .
14. Install the front door window regulator and motor. For additional information, refer to [Section 501-11](#) .
15. Install the front door glass top run. For additional information, refer to [Section 501-11](#) .

16. Apply the BALLISTIC PANEL label to the door trim panel just forward of the door latch handle.

**Inner Body Reinforcing Panels****General Equipment**

3 Phase Inverter Spot Welder 254-00002
Compuspot 700F Welder 190-50080
I4 Inverter Spot Welder 254-00014
Inverter Welder with MIG Welder 254-00015

**Material**

Item	Specification
Rust Inhibitor ValuGard™ VG104, VG104A (aerosol)	-
Premium Undercoating ValuGard™ VG101, VG101A (aerosol)	-
Seam Sealer TA-2	-

**Standard Wheelbase**

**NOTICE:** Sectioning procedures can only be carried out on the outer body side panel. No sectioning repairs can be carried out on inner reinforcement panels. Failure to follow these instructions may compromise the structural integrity of the vehicle

**NOTE:** Refer to the Ford Recommended Steel Repairability Matrix in the Specifications portion of this section for specific information regarding steel descriptions.

**NOTE:** Outer panels removed for clarity.

**NOTE:** Left side shown, right side similar.

Item	Part Number	Description
1	02039 LH/ 02038 RH	Cowl side panel high-strength steel
2	02509 LH/ 02508 RH	Front body pillar high-strength steel
3	02505 LH/ 02504 RH	Front body upper pillar mild steel
4	24301 LH/ 24300 RH	Center body pillar high-strength steel
5	51181 LH/ 51180 RH	Roof side inner rail high-strength steel
6		Front seat shoulder strap reinforcement (LH/RH) high-strength steel (part of 24301/24300)
7	24301 LH/ 24300 RH	Center body pillar serviced as assembly with No. 4 high-strength steel
8	27791 LH/ 27790 RH	Quarter panel inner high-strength steel
9	602A11	Rear seat shoulder strap reinforcement high-strength steel
10	278B11 LH/ 278B10 RH	Quarter panel extension mild steel
11	45115 LH/ 45114 RH	Luggage compartment drain trough mild steel
12	27887 LH/ 27886 RH	Quarter panel inner wheelhouse mild steel
13	20403 LH/ 20402 RH	Door frame opening reinforcement high-strength steel
14	22843 LH/ 22842 RH	Front door hinge reinforcement high-strength steel
15	204A07 LH/ 204A06 RH	Door frame reinforcement high-strength steel

### Long Wheelbase

Item	Part Number	Description
1	02039 LH/ 02038 RH	Cowl side panel high-strength steel
2	02509 LH/ 02508 RH	Front body pillar high-strength steel
3	02505 LH/ 02504 RH	Front body upper pillar mild steel
4	51181 LH/ 51180 RH	Roof side inner rail high-strength steel
5	279C91 LH/ 279C90 RH	Quarter panel upper rear extension mild steel
6	27791 LH/ 27790 RH	Quarter panel inner high-strength steel
7	602A11	Rear seat shoulder strap reinforcement high-strength steel
8	278B11 LH/ 278B10 RH	Quarter panel extension mild steel
9	45115 LH/ 45114 RH	Luggage compartment drain trough mild steel
10	27887 LH/ 27886 RH	Quarter panel inner wheelhouse mild steel
11	279C91 LH/ 279C90 RH	Quarter panel lower rear extension mild steel
12	24301 LH/ 24300 RH	Center body pillar serviced as assembly with No. 14 high-strength steel
13		Front seat shoulder strap reinforcement high-strength steel (part of 24301/24300)
14	24301 LH/ 24300 RH	Center body pillar high-strength steel
15	20403 LH/ 20402 RH	Door frame opening reinforcement high-strength steel

17	204A07 LH/ 204A06 RH	Door frame reinforcement high-strength steel

## Underbody

Item	Part Number	Description
1	101W24	Floor side member high strength steel
2	11135	Front floor pan assembly mild steel
3	11160	Center floor pan assembly mild steel
4	11215	Rear floor pan assembly mild steel
5	10638	Reinforcement high-strength steel
6	101W25	Floor side member (LH) high-strength steel
7	10117	Floor side inner (LH) mild steel
8	10116	Floor side inner (RH) mild steel

## Front Structure

Item	Part Number	Description
1	16K006	Inner fender assembly mild steel
2	16044	Fender apron plastic
3	02044	Cowl side inner panel mild steel
4	023A62	Windshield wiper mounting panel mild steel
5	02015	Cowl top outer mild steel
6	02030	Cowl top inner panel mild steel
7	02045	Cowl side inner panel mild steel
8	16045	Fender apron plastic
9	16K007	Inner fender assembly mild steel
10	01605	Dash panel laminated sound/vibration steel
11	16138	Radiator support mild steel

**⚠ WARNING:** Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

**⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#). Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** On vehicles equipped with Safety Canopy® options, prior to carrying out any sectioning repairs near the roof line or sail panel areas of the vehicle, remove the Safety Canopy® module and related components. Failure to comply may result in accidental deployment or damage to the Safety Canopy®. Refer to Section 501-20B . Failure to follow these instructions may result in serious injury to technician or vehicle occupant(s).

**⚠ WARNING:** Do not cut or grind body side components within 50 mm (1.96 in) of restraint anchoring points. Welding within 50 mm (1.96 in) of restraint anchoring points may result in incorrect operation of restraint devices. For additional restraints anchoring location information, refer to Section 501-20A and Section 501-20B . Failure to follow these instructions may result in serious injury to vehicle occupant(s).

**NOTE:** When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

1. Remove the outer body sheet metal from the affected area prior to carrying out any reinforcing panel replacement. For additional information, refer to Sectioning Guidelines in this section.

**NOTE:** Factory spot welds may be substituted with either resistance spot welds or Metal Inert Gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

**NOTE:** Observe prescribed welding procedures when carrying out any body side section repair. For additional information, refer to Welding Precautions - Steel in this section.

2. **NOTE:** When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

Remove the outer body sheet metal from the affected area prior to carrying out any reinforcing panel replacement. For additional information, refer to Sectioning Guidelines in this section.

3. When welding overlapping surfaces or substrates, apply corrosion protection material between the surfaces prior to welding. When the surfaces have been welded, apply corrosion protection material to the exterior surfaces or substrates. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.
  - Make sure horizontal joints and flanges are correctly sealed with seam sealer to prevent moisture intrusion. Water and moisture migrate to horizontal joints and corrosion tends to occur more rapidly in these areas. Metal surfaces must be clean and dry before applying seam sealer.
4. If equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B .
5. If equipped with an air suspension system, reactivate the power supply. This can be accomplished by reconnecting the battery or turning on the air suspension service switch located in the luggage compartment on the LH side.
6. Proceed with the refinish process following Ford-approved paint recommendations.

**Torque Specifications**

## SECTION 502-02: Full Frame and Body Mounting

2010 Crown Victoria, Grand Marquis  
Workshop Manual

## DESCRIPTION AND OPERATION

Procedure revision date: 12/02/2010

**Frame and Body Mounting**

Item	Part Number	Description
1	W709224	Front end body mount bolts
1	5400155	Front end body mount (lower)
1	5400396	Front end body mount (upper)
2	5C155	Bolt And Grommet Asy
2	5400396	Body support mount No. 1 (upper)
3	5C155	Bolt And Grommet Asy
3	5400396	Body support mount No. 2 (upper)
4	5C155	Bolt And Grommet Asy
4	5400396	Body support mount No. 3 (upper)
5	5C155	Bolt And Grommet Asy
5	5400396	Body support mount No. 4 (upper)
6	5C155	Bolt And Grommet Asy
6	5400396	Body support mount No. 5 (upper)
7	5C155	Bolt And Grommet Asy
7	5400396	Body support mount No. 6 (upper)

**NOTE:** For torque specifications, refer to the specifications table in this section.

The frame is bolted to the body and is used to:

- aid in structural support.
- provide mounting surfaces for the rear of the front suspension control arms.
- support the radiator.
- provide a mounting point for the front stabilizer bar.
- provide a mounting point for the No. 2 and No. 3 crossmembers.

The front No. 2 crossmember is bolted to the frame and is used to:

- aid in structural support.
- provide mounting surfaces for the front suspension control arms.

- provide a mounting point for the engine mounts.

The No. 3 crossmember is bolted to the frame and is used to:

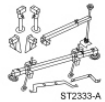

- aid in structural support.
- provide mounting surfaces for the rear transmission support insulator.

For body misalignment and checking, refer to Section 501-35 . Before welding is carried out on the vehicle, refer to Section 501-35 . For frame repair, refer to Section 501-35 .

---

**Crossmember - Number 2**

## Special Tool(s)

	Support Bar, Engine 303-F072
	Support Bar, Engine 303-639

N0070151

Item	Part Number	Description
1	N808349	Intermediate shaft bolt
2	3B676	Intermediate shaft
3	N804431	Crossmember bracket nut (4 required)
4	W709882	Crossmember bracket bolt (4 required)
5	W707492	Engine mount nut (2 required)
6	W520213	Stabilizer bar link nut (2 required)
7	W520214	Outer tie-rod end nut (2 required)
8	2N386	Brake caliper bolt (4 required)
9	2B120 RH/ 2B121 LH	Brake caliper (2 required)
10	W707492	Steering gear nut (2 required)
11	W707972	Steering gear stud (2 required)

12	3504	Steering gear
13	W708601	Lower control arm rear mounting bolt (6 required)
14	W707968	No. 2 crossmember bolt (4 required)
15	5C145	No. 2 crossmember

### Removal

**NOTICE:** Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major repair expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the generator. For additional information, refer to Section 414-00 .
2. Remove the 3 pin-type retainers and the radiator sight shield.
3. Install the Engine Support Bars.

4. Disconnect the RH ABS electrical connectors.

5. Disconnect the LH ABS electrical connectors.

6. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

**⚠ WARNING:** Shut off the electrical power to the air suspension system prior to hoisting or jacking an air suspension equipped vehicle. Failure to do so may result in unexpected inflation or deflation of the air springs, which may result in shifting of the vehicle during these operations. Failure to follow this instruction may result in serious personal injury.

Remove the LH and RH front wheel and tire assemblies. For additional information, refer to [Section 204-04](#).

7. **NOTICE:** Do not allow the intermediate shaft to rotate while it is disconnected from the steering gear or damage to the clockspring may result. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to [Section 501-20B](#).

Remove the bolt and detach the intermediate shaft from the steering gear.

8. Remove the 2 nuts and the 2 bolts from the LH No. 2 crossmember bracket and the 2 nuts and the 2 bolts from the RH No. 2 crossmember bracket.
- Separate the No. 2 crossmember brackets from the crossmember.

9. Raise and support the vehicle.

10. Remove the 2 engine mount nuts.

11. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while removing the nut.

Remove the 2 nuts and disconnect the LH and RH stabilizer bar links.

12. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while removing the nut.

Remove the 2 nuts and disconnect the LH and RH outer tie-rod ends.

13. Remove the 2 bolts and position the LH and RH brake hose and brackets assemblies aside.

14. Remove the 4 bolts and position the LH and RH brake calipers aside.
- Support the brake calipers away from the No. 2 crossmember.

15. Position the front LH and RH ABS harness aside.
1. Release the 2 ABS harnesses from the support bracket.
  2. Remove the 2 bolts and the brackets.
  3. Remove the 2 harness retainers from the frame.

16. Remove the 2 steering gear nuts.

17. Remove the 2 studs and position the steering gear aside.

- Support the steering gear away from the No. 2 crossmember.

18. Release the brake line from the retaining clips at the rear of the No. 2 crossmember.

19. Lower the vehicle.
20. Using the engine support bar, raise the engine to remove the engine weight from the No. 2 crossmember.
21. Raise and support the vehicle.
22. Remove the 3 LH lower control arm and 3 RH lower control arm rear mounting bolts.
23. Position a suitable support table under the No. 2 crossmember.
24. Remove the 4 No. 2 crossmember bolts.
25. Lower and remove the No. 2 crossmember assembly.

## Installation

1. **NOTE:** Position the sway bar and the rear bushing plates into place as the No. 2 crossmember is being raised.

Raise and position the No. 2 crossmember assembly.

2. Install the 4 No. 2 crossmember bolts.
  - Tighten to 250 Nm (184 lb-ft).
3. Position the LH and RH No. 2 crossmember brackets.
4. Remove the support table.
5. **NOTICE:** The bolts must be tightened in the sequence shown or damage to the crossmember bracket may occur.

Install the LH and RH No. 2 crossmember bracket nuts and bolts.

1. Tighten the rear bolt.

- ◆ Tighten to 103 Nm (76 lb-ft).
- 2. Tighten the front bolt.
  - ◆ Tighten to 103 Nm (76 lb-ft).
- 3. Tighten the nuts.
  - ◆ Tighten to 200 Nm (148 lb-ft).

- 6. Install the 3 LH lower control arm and 3 RH lower control arm rear mounting bolts.
  - Tighten to 90 Nm (66 lb-ft).
- 7. Position the brake line into the retaining clips at the rear of the No. 2 crossmember.

- 8. Install the LH and RH ABS harness.
  - 1. Install the 2 harness retainers into the frame.
  - 2. Install the 2 brackets and bolts.
  - 3. Install the 2 ABS harnesses into the support brackets.

- 9. Position the LH and RH brake calipers and install the 4 bolts.
  - Tighten to 32 Nm (24 lb-ft).
- 10. Position the LH and RH brake hose and brackets and install the 2 bolts.

- 11. Position the steering gear and install the 2 steering gear studs.
  - Tighten to 20 Nm (177 lb-in).

12. Install the 2 steering gear nuts.
  - Tighten to 103 Nm (76 lb-ft).

13. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while installing the nut.

Position the LH and RH stabilizer bar links and install the 2 nuts.

- Install new nuts.
- Tighten to 63 Nm (46 lb-ft).

14. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while installing the nut.

Position the LH and RH tie-rod ends and install the 2 nuts.

- Install new nuts.
- Tighten to 80 Nm (59 lb-ft).

15. Lower the vehicle.

16. Connect the intermediate shaft to the steering gear and install the bolt.
  - Tighten to 30 Nm (22 lb-ft).

17. Remove the Engine Support Bars.

18. Install the LH and RH front wheel and tire assemblies. For additional information, refer to [Section 204-04](#).

19. Connect the RH ABS electrical connectors.

20. Connect the LH ABS electrical connectors.

21. Install the generator. For additional information, refer to Section 414-00 .
  22. Position the radiator sight shield and install the 3 pin-type retainers.
  23. Raise and support the vehicle.
  24. Install the 2 engine mount nuts.
    - Tighten to 90 Nm (66 lb-ft).
  25. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**
  26. Check the front end alignment and adjust as necessary. For additional information, refer to Section 204-00 .
-

## Material

Item	Specification	Fill Capacity
Dye-Lite® Gasoline Engine Oil Leak Detection Dye 164-R3700 (Rotunda)	-	29.6 ml (1 oz)
High Temperature Retaining Compound Loctite® 620TM/Permatex® 62050, or equivalent; obtain locally	WSK-M2G349-A9	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A	-

## Engine

**NOTICE:** When repairing engines, all parts must be contamination free. If contamination/foreign material is present when repairing an engine, premature engine failure may occur.

**NOTE:** Specifications show the expected minimum or maximum condition. Refer to the appropriate section in Group 303 for the procedure.

**NOTE:** If a component fails to meet the specifications, it is necessary to refinish it or install a new component. Wear limits are provided as an aid to determine if the component can be refinished. A new component must be installed when any component fails to meet specifications and cannot be refinished.

**NOTE:** This section contains information, steps and procedures that may not be specific to this engine.

This section covers general procedures and diagnosis and testing of the engine system, except for exhaust emission control devices, which are covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

The engine incorporates the following features: Refer to the appropriate section in Group 303 for the procedure.

- Crankcase ventilation or breather system
- Exhaust emission control system
- Evaporative Emission (EVAP) control system

Some engines incorporate a fail-safe cooling system. Refer to the appropriate section in Group 303 for the procedure.

The engine, fuel system, ignition system, emissions system and exhaust system all affect exhaust emission levels and must be maintained according to the maintenance schedule. Refer to the scheduled Maintenance Guide.

Correct engine identification is required to order parts. Refer to the appropriate section in Group 303 for the procedure.

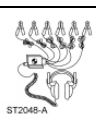

For complete vehicle and engine identification codes, refer to Section 100-01 .

---

**Engine**

## Special Tool(s)

 ST1300-A	12 Volt Master UV Diagnostic Inspection Kit 164-R0756 or equivalent (Leak Detector)
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST1298-A	Engine Cylinder Leak Detection/Air Pressurization Kit 014-00708 or equivalent
 ST2312-A	EngineEAR 107-R2100 or equivalent
 ST2048-A	EngineEAR/ChassisEAR 107-R2102 or equivalent
 ST1296-A	Oil Pressure Gauge 303-088 (T73L-6600-A)
 ST1299-A	Quick Disconnect Compression Tester 134-R0212 or equivalent
 ST1297-A	Vacuum/Pressure Tester 164-R0253 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

**⚠ WARNING: If equipped with fire suppression system, refer to Section 100-02B for Important Safety Warnings. Failure to follow this instruction may result in serious personal injury.**

There are 2 diagnostic paths that can be followed depending on the type of engine concern. Carry out either the Inspection and Verification - Engine Performance or Inspection and Verification - NVH.

### Inspection and Verification - Engine Performance

1. Verify the customer concern by operating the engine to duplicate the condition.
2. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

#### Visual Inspection Chart

Mechanical
<ul style="list-style-type: none"> <li>• Engine coolant leaks</li> <li>• Engine oil leaks</li> <li>• Fuel leaks</li> <li>• Damaged or severely worn parts</li> <li>• Loose mounting bolts, studs and nuts</li> </ul>

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.
4. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
  - verify the ignition key is in the ON position.
  - verify the scan tool operation with a known good vehicle.
  - refer to Section 418-00 to diagnose no response from the PCM.
7. Carry out the network test.
  - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
  - If the network test passes, retrieve and record continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.

9. If the DTCs retrieved are related to the concern, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Engine Performance .

### Inspection and Verification - NVH

1. NVH symptoms should be identified using the diagnostic tools and techniques that are available. For a list of these techniques, tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 .
2. Verify the customer concern by operating the engine to duplicate the condition.
3. Check the engine oil level and check the oil for contamination. Low engine oil level or contaminated oil are a common cause of engine noise. If the oil is contaminated, the source of the contamination must be identified and repaired as necessary.
4. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

#### Visual Inspection Chart

Mechanical
<ul style="list-style-type: none"> <li>• Loose mounting bolts, studs and nuts</li> <li>• Damaged or leaking powertrain mounts</li> <li>• Damaged or disconnected vacuum hoses</li> <li>• Obstruction of cooling fan</li> <li>• Obstruction of Front End Accessory Drive (FEAD)</li> <li>• Damaged or disconnected air intake components</li> </ul>

5. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.
6. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

7. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
  - check the scan tool connection to the VCM .
  - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.
8. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 to diagnose no response from the PCM.
  9. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .

- If the network test passes, retrieve and record continuous memory DTCs.
10. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
  11. If the DTCs retrieved are related to the concern, refer to Section 419-10.
  12. If no DTCs related to the concern are retrieved, continue the inspection and verification if a noise concern is related to the engine. For vibration concerns and noise concerns such as powertrain mounts, air intake system and starter, GO to Symptom Chart - NVH.

In some cases, a noise may be a normal characteristic of that engine type. In other cases the noise may require further investigation. Comparing the noise to a similar year/model vehicle equipped with the same engine will aid in determining if the noise is normal or abnormal.

Once a customer concern has been identified as an abnormal engine noise, it is critical to determine the location of the specific noise. Use the EngineEAR/ChassisEAR or stethoscope (the noise will always be louder closer to the noise source) to isolate the location of the noise to one of the following areas.

- Fuel injector(s)
- Upper end of engine
- Lower end of engine
- Front of engine
- Rear of engine

#### **Fuel injector noise**

A common source of an engine ticking noise can be related to the fuel injector(s). This is normal engine noise that can be verified by listening to another vehicle. If the injector noise is excessive or irregular, use the EngineEAR/ChassisEAR or stethoscope to isolate the noise to a specific fuel injector.

#### **Upper end engine noise**

A common source of upper end engine noise (ticking, knocking or rattle) include the camshaft(s) and valve train. Upper end engine noise can be determined using the EngineEAR/ChassisEAR or stethoscope on the valve cover bolts. If the noise is loudest from the valve cover bolts, then the noise is upper end. The EngineEAR/ChassisEAR or stethoscope can be used to further isolate the noise to the specific cylinder bank and cylinder. Removal of the valve covers will be required to pinpoint the source of the noise.

#### **Lower end engine noise**

A common source of lower end engine noise (ticking or knocking) include the crankshaft, connecting rod(s) and bearings. Lower end noises can be determined by using the oil pan or cylinder block lug bosses. If the noise is loudest from these areas, then the noise is lower end. If an engine noise is isolated to the lower end, some disassembly of the engine may be required to inspect for damage or wear.

#### **Front of engine noise**

A common source of noise from the front of the engine (squeal, chirp, whine or hoot) is the Front End Accessory Drive (FEAD) components. To isolate FEAD noise, carry out the Engine Accessory Test, refer to Section 100-04.

Some other noises from the front of the engine (ticking, tapping or rattle) may be internal to the engine. Use the EngineEAR/ChassisEAR or stethoscope on the engine front cover to determine if the noise is internal to the engine. Removal of the engine front cover may be necessary to inspect internal engine components.

## Rear of engine noise

A common source of noise from the rear of the engine (knocking) is the flexplate. Inspection of the flexplate will be necessary.

Some engines have timing drive components at the rear of the engine and may be the source of noise (ticking, knocking or rattle). Use the EngineEAR/ChassisEAR or stethoscope on the rear of the engine if you suspect the noise is internal to the engine. Some disassembly of the engine may be required to inspect for damage or wear.

13. After you have localized the noise, note the characteristics of the noise, including type of noise, frequency and conditions when the noise occurs and GO to Symptom Chart - NVH .

## Symptom Chart - Engine Performance

Symptom Chart - Engine Performance

## Symptom Chart - NVH

Symptom Chart - NVH

**NOTE:** NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible that any one of multiple systems may be the cause of the symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

### ConditionPossible SourcesAction

- Drone type noise
- Powertrain mount(s)
- CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section. TEST the system for normal operation after the repair.
- Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent
- Engine vibration excites the body resonances inducing interior noise
- CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section. TEST the system for normal operation after the repair.
- Engine drumming noise - accompanied by vibration
- Powertrain mount(s)
- CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section. TEST the system for normal operation after the repair.

- Rattle - occurs at idle or at light acceleration from a stop
- Powertrain mount(s)
- CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, REFER to Section 303-01 . For transmission, REFER to Section 307-01 . TEST the system for normal operation after the repair.
- Whine/moan type noise - pitch increases or changes with vehicle speed
- Powertrain mount(s)
- CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, REFER to Section 303-01 . For transmission, REFER to Section 307-01 . TEST the system for normal operation after the repair.
- Clunk - occurs when shifting from PARK or between REVERSE and DRIVE
- Powertrain mounts
- CHECK the powertrain/drivetrain mounts for damage. INSTALL new mounts as necessary. For engine, REFER to Section 303-01 . For transmission, REFER to Section 307-01 . TEST the system for normal operation after the repair.
- Idle speed is too high
- CHECK for the correct idle speed.
- Accessory drive bearing hoot - occurs at idle or high idle in cold temperatures of approximately +4°C (+40°F) or colder at the first start of the day
- Accessory drive idler or tensioner pulley bearing is experiencing stick/slip between ball bearings and the bearing race
- CARRY OUT the engine cold soak procedure. REFER to Section 100-04 .
- PLACE the EngineEAR probe directly on the idler/tensioner center post or bolt to verify which bearing is making the noise. INSTALL new parts as necessary. REFER to Section 303-05 . TEST the system for normal operation after the repair.
- Accessory drive belt noise, squeal or chirping
- Defective/worn or incorrect accessory drive belt
- Misaligned pulley(s)
- Pulley runout
- Damaged or worn accessory drive component or idler
- Fluid contamination of the accessory drive belt or pulleys
- Damaged or worn accessory drive belt tensioner
- Damaged pulley grooves
- CARRY OUT the Engine Accessory Test. REFER to Section 100-04 . INSPECT components and INSTALL new parts as necessary. REFER to Section 303-05 . TEST the system for normal operation after the repair.
- Clunking noise

- Coolant pump has excessive end play or imbalance
- CHECK the coolant pump for excessive end play. INSPECT the coolant pump for imbalance with the drive belt off. INSTALL a new coolant pump as necessary. REFER to Section 303-03 . TEST the system for normal operation after the repair.
- Whine or moaning noise
- Air intake system
- CHECK the air cleaner and ducts for correct fit. INSPECT the air intake system for leaks or damage. REPAIR as necessary. TEST the system for normal operation after the repair.
- Whistling noise - normally accompanied with poor idle condition
- Air intake system
- CHECK the air intake ducts, air cleaner, throttle body and vacuum hoses for leaks and correct fit. REPAIR or ADJUST as necessary. TEST the system for normal operation after the repair.
- Hissing noise - occurs during idle or high idle that is apparent with the hood open
- Vehicles with a plastic intake manifold
- Acceptable condition. Some plastic manifolds exhibit this noise, which is the effect of the plastic manifold.
- Grinding noise - occurs during engine cranking
- Incorrect starter motor mounting
- INSPECT the starter motor for correct mounting. REPAIR as necessary. REFER to Section 303-06 . TEST the system for normal operation after the repair.
- Starter motor
- CHECK the starter motor. INSTALL a new starter motor as necessary. REFER to Section 303-06 . TEST the system for normal operation after the repair.
- Incorrect starter motor drive engagement
- INSPECT the starter motor drive for wear or damage. INSTALL a new starter motor as necessary. REFER to Section 303-06 . TEST the system for normal operation after the repair.
- INSPECT the flexplate for wear or damage. INSTALL a new flexplate as necessary. REFER to Section 303-01 . TEST the system for normal operation after the repair.
- Engine noise, front of engine - knocking noise from lower front of engine
- Damaged or separated crankshaft pulley/damper
- CHECK for obvious signs of damage or wobble during operation. INSTALL new as necessary. REFER to Section 303-01 . TEST the system for normal operation after the repair.
- Engine noise, front of engine - ticking, tapping or rattling noise from the front of the engine

- Timing drive components
- REMOVE the accessory drive belt. REFER to Section 303-05 .
- USE the EngineEAR to isolate the noise to the engine front cover.
- REMOVE the engine front cover and INSPECT the timing drive components. INSTALL new parts as necessary. REFER to Section 303-01 . TEST the system for normal operation after the repair.
- Engine noise, upper end - ticking noise near the fuel rail and intake manifold
- Fuel rail clip
- CHECK for loose or damaged fuel rail clip(s). REPAIR as necessary. TEST the system for normal operation after the repair.
- Fuel injector
- USE the EngineEAR to isolate the noisy injector(s). INSTALL a new injector(s) as necessary. REFER to Section 303-04 . TEST the system for normal operation after the repair.
- Engine noise, upper end - ticking, knocking or rattle noise that occurs during idle or high idle during the first cold start of the day and may disappear as the engine warms
- Valve train noise (bled down valve/lash adjuster)
- CARRY OUT the Valve Train Analysis Component Test in this section. INSTALL new parts as necessary. TEST the system for normal operation after the repair.
- Engine noise, upper end - occurs mostly with a warm engine at light/medium acceleration
- Worn or damaged spark plugs
- REMOVE the spark plugs. INSPECT and INSTALL new as necessary. REFER to Section 303-07 . TEST the system for normal operation after the repair.
- Carbon accumulation in combustion chamber
- Bore scope the cylinder. ELIMINATE carbon buildup. TEST the system for normal operation after the repair.
- Engine noise, upper end - rattling noise from the valve train. Worse when the engine is cold
- Low oil level
- CHECK the oil level. FILL as necessary. TEST the system for normal operation after the repair.
- Thin or diluted oil
- INSPECT the oil for contamination. If the oil is contaminated, CHECK for the source. REPAIR as necessary. CHANGE the oil and filter. TEST the system for normal operation after the repair.
- Low oil pressure
- CARRY OUT an oil pressure test. If not within specifications, REMOVE the engine oil pan. REFER to Section 303-01 . INSPECT for a blocked oil pick up tube.

- Worn valve train components
- CARRY OUT the Valve Train Analysis Component Test in this section. INSTALL new parts as necessary. TEST the system for normal operation after the repair.
- Worn valve guides
- CARRY OUT the Valve Guide Inner Diameter procedure in this section.
- Excessive runout of the valve seats on the valve face
- CARRY OUT the Valve Seat Inspection procedure in this section.
- Engine noise, upper end - pinging noise
- Gasoline octane too low
- VERIFY with customer the type of gasoline used. CORRECT as necessary. TEST the system for normal operation after the repair.
- Knock Sensor (KS) operation
- CHECK the KS . INSTALL a new KS as necessary. REFER to Section 303-14 .
- Incorrect spark timing
- CHECK the spark timing. REPAIR as necessary. TEST the system for normal operation after the repair.
- High operating temperature
- INSPECT the cooling system for leaks. CHECK the coolant level. REFILL as necessary. CHECK the coolant for the correct mix ratio. DRAIN and REFILL as needed. VERIFY the engine operating temperature is within specifications. REPAIR as necessary. TEST the system for normal operation after the repair.
- Spark plug
- CHECK the spark plugs. REPAIR or INSTALL new spark plugs as necessary. TEST the system for normal operation after the repair.
- Catalytic converter
- Acceptable noise.
- Engine noise, lower end - ticking or knocking noise near the oil filter adapter
- Oil pump
- USE the EngineEAR to verify the oil pump as the source of the noise at low rpm. REPAIR as necessary. REFER to Section 303-01 . TEST the system for normal operation after the repair.
- Engine noise, lower end - light knocking noise, also described as piston slap. Noise is most noticeable when the engine is cold with light to medium acceleration. The noise disappears as the engine warms

- Excessive clearance between the piston and the cylinder wall
- CARRY OUT the Piston To Cylinder Bore Clearance procedure in this section.
- Engine noise, lower end - light double knock or sharp rap sound. Occurs mostly with a warm engine at idle or low speeds in drive. Increases in relation to engine load. Associated with a poor lubrication history
- Excessive clearance between the piston and the piston pin
- CARRY OUT the Piston Pin Bore Diameter procedure in this section.
- Engine noise, lower end - light knocking noise. The noise is most noticeable when the engine is warm. The noise tends to decrease when the vehicle is coasting or in neutral
- Excessive clearance between the connecting rod bearings and the crankshaft
- CARRY OUT the Connecting Rod Bearing Journal-to-Bearing Clearance procedure in this section.
- Engine noise, lower end - deep knocking noise. The noise is most noticeable when the engine is warm, at lower rpm and under a light load and then at float
- Worn or damaged crankshaft main bearings
- CARRY OUT the Crankshaft Main Bearing Journal-to-Bearing Clearance procedure in this section.
- Engine noise, rear of engine - knocking noise at rear of engine
- Damaged flexplate
- CARRY OUT the Flexplate Inspection procedure in this section.
- Engine vibration - vibration felt at all times
- Excessive engine pulley runout
- CARRY OUT the Engine Accessory Test. INSTALL a new engine pulley as necessary. REFER to Section 303-01 . TEST the system for normal operation after the repair.
- Damaged or worn accessory component
- CARRY OUT the Engine Accessory Test. REPAIR or INSTALL a new component as necessary. TEST the system for normal operation after the repair.
- Engine vibration - at idle, a low-frequency vibration (5-20 Hz) or mild shake that is felt through the seat/floorpan
- Cylinder misfire
- Using the scan tool, CARRY OUT the cylinder power balance and the relative compression test. REPAIR as necessary. REFER the Section 303-01 . TEST the system for normal operation after the repair.
- Engine or torque converter out of balance

- VERIFY the torque converter to crankshaft pilot clearance is correct. REPAIR as necessary. RE-INDEX the torque converter on the flex plate by 120 degrees for a 3-bolt converter or 180 degrees for a 4-bolt converter. REFER to Section 307-01 . TEST the system for normal operation after the repair.
- Engine vibration - is felt with increases and decreases in engine rpm
- Powertrain mount(s)
- CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, REFER to Section 303-01 . For the transmission, REFER to Section 307-01 . TEST the system for normal operation after the repair.
- Engine or transmission grounded to chassis
- INSPECT the powertrain/drivetrain for correct clearances. REPAIR as necessary. TEST the system for normal operation after the repair.
- Engine vibration - increases intensity as the engine rpm is increased
- Engine out-of-balance
- CARRY OUT the Neutral Engine Run-Up (NERU) Test. REFER to Section 100-04 . ROTATE the torque converter, 120 degrees for 3-bolt or 180 degrees for 4-bolt. INSPECT the torque converter pilot outer diameter-to-crankshaft pilot inner diameter. REPAIR as necessary. REFER to Section 307-01 . TEST the system for normal operation after the repair.
- Engine vibration - mostly at coast/neutral coast. Condition improves with vehicle acceleration
- Combustion instability
- CHECK the ignition system. INSTALL new components as necessary. REFER to Section 303-07 . TEST the system for normal operation after the repair.
- Engine vibration or shudder - occurs with light to medium acceleration above 56 km/h (35 mph)
- Worn or damaged spark plugs
- INSPECT the spark plugs for cracks, high resistance or broken insulators. INSTALL a new spark plug(s) as necessary. REFER to Section 303-07 . TEST the system for normal operation after the repair.
- Plugged fuel injector
- REPAIR or INSTALL a new injector as necessary. REFER to Section 303-04 . TEST the system for normal operation after the repair.
- Contaminated fuel
- INSPECT the fuel for contamination. DRAIN the fuel system and refill. TEST the system for normal operation after the repair.

## Component Tests

The following component tests are used to diagnose engine concerns.

### Engine Oil Leaks

**⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B** . Failure to follow the instructions may result in serious personal injury.

**NOTE:** When diagnosing engine oil leaks, the source and location of the leak must be positively identified prior to repair.

Prior to carrying out this procedure, clean the cylinder block, cylinder heads, valve covers, oil pan and flywheel with a suitable solvent to remove all traces of oil.

### Engine Oil Leaks - Fluorescent Oil Additive Method

Use the 12 Volt Master UV Diagnostic Inspection Kit to carry out the following procedure for oil leak diagnosis.

1. Add 29.6 ml (1 oz) of gasoline engine oil dye to a minimum of 0.47L (1/2 qt) and a maximum of 0.95L (1 qt) engine oil and fill through the engine oil fill. Thoroughly premix the gasoline engine oil dye or it will not have enough time to reach the crankcase, oil galleries and seal surfaces during this particular 15 minute test. The additive must be mixed well with oil and added through the oil fill. Check the level on the oil level indicator to determine what amount of oil to premix. If it is in the middle of the crosshatch area or below the full mark, use 0.95L (1 qt). If it is at the full mark, use 0.47L (1/2 qt).
2. Run the engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using the UV Leak Detector Kit. A clear bright yellow or orange area will identify the leak. For extremely small leaks, several hours may be required for the leak to appear.
3. At the end of test, make sure the oil level is within the upper and lower oil indicator marks. Remove oil as necessary if it registers above the full mark.

### Leakage Points - Underhood

Examine the following areas for oil leakage:

- Valve cover gaskets
- Intake manifold gaskets
- Cylinder head gaskets
- Oil bypass filter
- Oil filter adapter
- Engine front cover
- Oil filter adapter and filter body
- Oil level indicator tube connection
- Engine Oil Pressure (EOP) switch

### Leakage Points - Under Engine, With Vehicle on Hoist

Examine the following areas for oil leakage:

- Oil pan gaskets

- Oil pan sealer
- Oil pan rear seal
- Engine front cover gasket
- Crankshaft front seal
- Crankshaft rear oil seal
- Crankshaft main bearing cap side bolts
- Oil filter adapter and filter body
- Oil cooler, if equipped

### Leakage Points - With Transmission and Flywheel Removed

**⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

Examine the following areas for oil leakage:

- Crankshaft rear oil seal
- Rear main bearing cap parting line
- Rear main bearing cap seals
- Flexplate mounting bolt holes (with flexplate installed)
- Camshaft rear bearing covers or pipe plugs at the end of oil passages

Oil leaks at crimped seams in sheet metal parts and cracks in cast or stamped parts can be detected when using the dye method.

### Compression Test

**⚠ WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.**

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.
2. Set the throttle plates in the wide-OPEN position.
3. Install a compression gauge such as the Compression Tester in the No. 1 cylinder.
4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes necessary to obtain the highest reading.
5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.
6. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

## Compression Test - Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

### Compression Pressure Limit Chart

Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure
924 kPa (134 psi)	696 kPa (101 psi)	1,131 kPa (164 psi)	848 kPa (123 psi)	1,338 kPa (194 psi)	1,000 kPa (145 psi)	1,544 kPa (224 psi)	1,158 kPa (168 psi)
938 kPa (136 psi)	703 kPa (102 psi)	1,145 kPa (166 psi)	855 kPa (124 psi)	1,351 kPa (196 psi)	1,014 kPa (147 psi)	1,558 kPa (226 psi)	1,165 kPa (169 psi)
952 kPa (138 psi)	717 kPa (104 psi)	1,158 kPa (168 psi)	869 kPa (126 psi)	1,365 kPa (198 psi)	1,020 kPa (148 psi)	1,572 kPa (228 psi)	1,179 kPa (171 psi)
965 kPa (140 psi)	724 kPa (105 psi)	1,172 kPa (170 psi)	876 kPa (127 psi)	1,379 kPa (200 psi)	1,034 kPa (150 psi)	1,586 kPa (230 psi)	1,186 kPa (172 psi)
979 kPa (142 psi)	738 kPa (107 psi)	1,186 kPa (172 psi)	889 kPa (129 psi)	1,393 kPa (189 psi)	1,041 kPa (151 psi)	1,600 kPa (232 psi)	1,200 kPa (174 psi)
993 kPa (135 psi)	745 kPa (108 psi)	1,200 kPa (174 psi)	903 kPa (131 psi)	1,407 kPa (204 psi)	1,055 kPa (153 psi)	1,614 kPa (234 psi)	1,214 kPa (176 psi)
1,007 kPa (146 psi)	758 kPa (110 psi)	1,214 kPa (176 psi)	910 kPa (132 psi)	1,420 kPa (206 psi)	1,062 kPa (154 psi)	1,627 kPa (236 psi)	1,220 kPa (177 psi)
1,020 kPa (148 psi)	765 kPa (111 psi)	1,227 kPa (178 psi)	917 kPa (133 psi)	1,434 kPa (208 psi)	1,075 kPa (156 psi)	1,641 kPa (238 psi)	1,227 kPa (178 psi)
1,034 kPa (150 psi)	779 kPa (113 psi)	1,241 kPa (180 psi)	931 kPa (135 psi)	1,448 kPa (210 psi)	1,083 kPa (157 psi)	1,655 kPa (240 psi)	1,241 kPa (180 psi)
1,048 kPa (152 psi)	786 kPa (114 psi)	1,255 kPa (182 psi)	936 kPa (136 psi)	1,462 kPa (212 psi)	1,089 kPa (158 psi)	1,669 kPa (242 psi)	1,248 kPa (181 psi)
1,062 kPa (154 psi)	793 kPa (115 psi)	1,269 kPa (184 psi)	952 kPa (138 psi)	1,476 kPa (214 psi)	1,103 kPa (160 psi)	1,682 kPa (244 psi)	1,262 kPa (183 psi)
1,076 kPa (156 psi)	807 kPa (117 psi)	1,282 kPa (186 psi)	965 kPa (140 psi)	1,489 kPa (216 psi)	1,117 kPa (162 psi)	1,696 kPa (246 psi)	1,269 kPa (184 psi)
1,089 kPa (158 psi)	814 kPa (118 psi)	1,296 kPa (188 psi)	972 kPa (141 psi)	1,503 kPa (218 psi)	1,124 kPa (163 psi)	1,710 kPa (248 psi)	1,282 kPa (186 psi)
1,103 kPa (160 psi)	827 kPa (120 psi)	1,310 kPa (190 psi)	979 kPa (142 psi)	1,517 kPa (220 psi)	1,138 kPa (165 psi)	1,724 kPa (250 psi)	1,289 kPa (187 psi)
1,110 kPa (161 psi)	834 kPa (121 psi)	1,324 kPa (192 psi)	993 kPa (144 psi)	1,631 kPa (237 psi)	1,145 kPa (166 psi)	—	—

N0096835

If one or more cylinders reads low, squirt approximately one tablespoon of engine oil meeting Ford specification on top of the pistons in the low-reading cylinders. Repeat the compression pressure check on these cylinders.

### Compression Test - Interpreting Compression Readings

1. If compression improves considerably, piston rings are worn or damaged.
2. If compression does not improve, valves are sticking or not seating correctly.
3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.  
Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75% of the highest reading.

### Cylinder Leakage Detection

When a cylinder produces a low reading, use of the Engine Cylinder Leak Detection/Air Pressurization Kit will be helpful in pinpointing the exact cause.

The leakage detector is inserted in the spark plug hole, the piston is brought up to top dead center on the compression stroke, and compressed air is admitted.

Once the combustion chamber is pressurized, a special gauge included in the kit will read the percentage of leakage. Leakage exceeding 20% is excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak at the intake valve will be heard in the throttle body. A leak at the exhaust valve can be heard at the tailpipe. Leakage past the piston rings will be audible at the PCV connection. If air is passing through a blown head gasket to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder block or gasket leakage into the cooling system may be detected by a stream of bubbles in the radiator.

### Excessive Engine Oil Consumption

Nearly all engines consume oil, which is essential for normal lubrication of the cylinder bore walls and pistons and rings. Determining the level of oil consumption may require testing by recording how much oil is being added over a given set of miles.

Customer driving habits greatly influence oil consumption. Mileage accumulated during towing or heavy loading generates extra heat. Frequent short trips, stop-and-go type traffic or extensive idling, prevent the engine from reaching normal operating temperature. This prevents component clearances from reaching specified operating ranges.

The following diagnostic procedure may be utilized to determine internal oil consumption. Make sure that the concern is related to internal oil consumption, and not external leakage, which also consumes oil. Verify there are no leaks before carrying out the test. Once verified, the rate of internal oil consumption can be tested.

A new engine may require extra oil in the early stages of operation. Internal piston-to-bore clearances and sealing characteristics improve as the engine breaks in. Engines are designed for close tolerances and do not require break-in oils or additives. Use the oil specified in the Owner's Literature. Ambient temperatures may determine the oil viscosity specification. Verify that the correct oil is being used for the vehicle in the geographic region in which it is driven.

### Basic Pre-checks

1.  **WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B. Failure to follow the instructions may result in serious personal injury.**

For persistent complaints of oil consumption, interview the customer to determine the oil consumption characteristics. If possible, determine the brand and grade of oil currently in the oil pan. Look at the oil filter or oil-change station tags to determine if Ford-recommended maintenance schedules have been followed. Make sure that the oil has been changed at the specified mileage intervals. If vehicle mileage is past the first recommended drain interval, the OEM production filter should have been changed.

2. Ask how the most current mileage was accumulated. That is, determine whether the vehicle was driven under the following conditions:
  - Extended idling or curbside engine operation
  - Stop-and-go traffic or taxi operation
  - Towing a trailer or vehicle loaded heavily
  - Frequent short trips (engine not up to normal operating temperature)
  - Excessive throttling or high engine-rpm driving
3. Verify that there are no external leaks. If necessary, review the diagnostic procedure under Engine Oil Leaks in the Diagnosis and Testing portion of this section.
4. Inspect the crankcase ventilation system for:

- disconnected hoses at the valve cover or throttle body.
  - loose or missing valve cover fill cap.
  - missing or incorrectly seated engine oil level indicator.
  - incorrect or dirty PCV valve.
  - a PCV valve grommet unseated in the valve cover (if so equipped).
5. Inspect for signs of sludge. Sludge affects PCV performance and can plug or restrict cylinder head drainback wells. It can also increase oil pressure by restricting passages and reducing the drainback capability of piston oil control rings. Sludge can result from either excessive water ingestion in the crankcase or operation at extremely high crankcase temperatures.
  6. Inspect the air filter for dirt, sludge or damage. A hole in the filter element will allow unfiltered air to bypass into the air induction system. This can cause premature internal wear (engine dusting), allowing oil to escape past rings, pistons, valves and guides.
  7. If the engine is hot or was recently shut down, wait at least 5 minutes to allow the oil to drain back. Ask the customer if this requirement has been followed. Adding oil without this wait period can cause an overfill condition, leading to excessive oil consumption and foaming which may cause engine damage.
  8. Make sure the oil level indicator (dipstick) is correctly and fully seated in the indicator tube. Remove the oil level indicator and record the oil level.
  9. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

### Detailed Pre-checks

1. Check the thermostat opening temperature to make sure that the cooling system is operating at the specified temperature. If it is low, internal engine parts are not running at specified internal operating clearances.
2. Verify the spark plugs are not oil saturated. Oil leaking into one or more cylinders will appear as an oil soaked condition on the plug. If a plug is saturated, a compression check may be necessary at the conclusion of the oil consumption test.

### Oil Consumption Test

Once all of the previous conditions are met, carry out an oil consumption test.

1. **⚠ WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.**

Drain the engine oil and remove the oil filter. Install a new manufacturer-specified oil filter. Make sure the vehicle is positioned on a level surface. Refill the oil pan to a level **one liter (quart) less** than the specified fill level, using manufacturer-specified oil.

2. Run the engine for 3 minutes (if hot) or 10 minutes (if cold). Allow for a minimum 5-minute drainback period and then record the oil level shown on the oil level indicator. Place a mark on the backside of the oil level indicator noting the oil level location.

3. Add the final one liter (quart) to complete the normal oil fill. Restart the engine and allow it to idle for 2 minutes. Shut the engine down.
4. After a 5-minute drainback period, record the location of the oil level again. Mark the oil level indicator with the new oil level location. (Note: Both marks should be very close to the MIN-MAX upper and lower limits or the upper and lower holes on the oil level indicator. These marks will exactly measure the engine's use of oil, with a one quart differential between the new marks.) Demonstrate to the customer that the factory-calibrated marks on the oil level indicator are where the oil should fall after an oil change with the specified fill amount. Explain however, that this may vary slightly between MIN-MAX or the upper and lower holes on the oil level indicator.
5. Record the vehicle mileage.
6. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

7. Advise the customer that oil level indicator readings must be taken every 320 km (200 mi) or weekly, using the revised marks as drawn. Remind the customer that the engine needs a minimum 5-minute drainback for an accurate reading and that the oil level indicator must be firmly seated in the tube prior to taking the reading.
8. When the subsequent indicator readings demonstrate a full liter (quart) has been used, record the vehicle mileage. The mileage driven between the 2 readings should not be less than 4,800 km (3,000 miles). The drive cycle the vehicle has been operated under must be considered when making this calculation. It may be necessary to have the customer bring the vehicle in for a periodic oil level indicator reading to closely monitor oil usage.

### Post Checks, Evaluation and Corrective Action

1. If test results indicate excessive oil consumption, carry out a cylinder compression test. The cylinder compression test should be carried out with a fully charged battery and all spark plugs removed. See the Compression Test Chart in this section for pressure range limits.
2. Compression should be consistent across all cylinders. Refer to the Compression Testing portion of this section. If compression tested within the specifications found in this section, the excessive oil consumption may be due to wear on the valve guides, valves or valve seals.
3. A cylinder leak detection test can be carried out using an Engine Cylinder Leak Detection/Air Pressurization Kit. This can help identify valves, piston rings, or worn valve guides/valve stems, inoperative valve stem seals or other related areas as the source of oil consumption.

**NOTE:** An oil-soaked appearance on the porcelain tips of the spark plugs also indicates excessive oil use. A typical engine with normal oil consumption will exhibit a light tan to brown appearance. See Spark Plug Analysis in this section for details. A single or adjoining, multiple cylinder leak can be traced by viewing the tips.

4. If an internal engine part is isolated as the root cause, determine if the repair will exceed cost limits and proceed with a repair strategy as required.
5. Once corrective action to engine is complete and verifying that all pre-check items were eliminated in the original diagnosis, repeat the Oil Consumption Test as described above and verify consumption

results.

### Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect the Vacuum/Pressure Tester to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is conducted. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 ft) of elevation above sea level.

The reading should be steady. If necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust the damper until the needle moves easily without excessive flutter.

### Intake Manifold Vacuum Test - Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

1. **NORMAL READING:** Needle between 51-74 kPa (15-22 in-Hg) and holding steady.
2. **NORMAL READING DURING RAPID ACCELERATION AND DECELERATION:** When the engine is rapidly accelerated (dotted needle), the needle will drop to a low reading (not to zero). When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.
3. **NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP:** The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.
4. **WORN RINGS OR DILUTED OIL:** When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).
5. **STICKING VALVES:** When the needle (dotted) remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.

6. **BURNED OR WARPED VALVES:** A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient valve clearance will also cause this reaction.
7. **POOR VALVE SEATING:** A small but regular downscale flicking can mean one or more valves are not seating.
8. **WORN VALVE GUIDES:** When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.
9. **WEAK VALVE SPRINGS:** When the needle oscillation becomes more violent as engine rpm is increased, weak valve springs are indicated. The reading at idle could be relatively steady.
10. **LATE VALVE TIMING:** A steady but low reading could be caused by late valve timing.
11. **IGNITION TIMING RETARDING:** Retarded ignition timing will produce a steady but somewhat low reading.
12. **INSUFFICIENT SPARK PLUG GAP:** When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.
13. **INTAKE LEAK:** A low, steady reading can be caused by an intake manifold or throttle body gasket leak.
14. **BLOWN HEAD GASKET:** A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head-to-cylinder block surface.
15. **RESTRICTED EXHAUST SYSTEM:** When the engine is first started and is idled, the reading may be normal, but as the engine rpm is increased, the back pressure caused by a clogged muffler, kinked tailpipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.
16. When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory unit such as the power brake booster, the unit will not function correctly. Always fix vacuum leaks.

### Oil Pressure Test

1. ** WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B. Failure to follow the instructions may result in serious personal injury.**

Disconnect and remove the EOP switch from the engine.

2. Connect the Engine Oil Pressure Gauge to the EOP switch oil galley port.
3. Run the engine until normal operating temperature is reached.
4. Run the engine at the specified rpm and record the gauge reading.

5. The oil pressure should be within specifications; for additional information, refer to the specification chart in the appropriate engine section.
6. If the pressure is not within specification, check the following possible sources:
  - Insufficient oil
  - Oil leakage
  - Worn or damaged oil pump
  - Oil pump screen cover and tube
  - Excessive main bearing clearance
  - Excessive connecting rod bearing clearance
7. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

### Valve Train Analysis

The following component tests are used to diagnose valve train concerns.

#### Valve Train Analysis - Engine Off, Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

#### Valve Train Analysis - Camshaft, Camshaft Roller Followers and Hydraulic Lash Adjusters

- Check for broken or damaged parts.
- Check for loose mounting bolts on camshaft caps.
- Check for plugged oil feed in the camshaft roller followers, lash adjusters or cylinder heads.

#### Valve Train Analysis - Valve Springs, Valve Spring Retainer and Valve Spring Retainer Keys

- Check for broken or damaged parts.
- Check for correct seating of the valve spring retainer key on the valve stem and in valve spring retainer.
- Check for correct seating on the valve stem.

#### Valve Train Analysis - Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged guide-mounted valve stem seal.
- Check collapsed hydraulic lash adjuster.
- Check installed valve spring height.
- Check for missing or worn valve spring seats.
- Check for plugged oil metering orifice in cylinder head oil reservoir (if equipped).

#### Valve Train Analysis - Camshaft Lobe Lift

Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the valve covers.
2. Remove the spark plugs. Refer to [Section 303-07](#) .
3. Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of the Dial Indicator is on top of the camshaft lobe and on the same plane as the hydraulic lash adjuster.
4. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

5. Zero the Dial Indicator. Continue to rotate the crankshaft until the (1) high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).
  6. To check the accuracy of the original Dial Indicator reading, continue to rotate crankshaft until the (2) base circle is reached. The Dial Indicator reading should be zero. If zero reading is not obtained, repeat Steps 1 through 6.
  7. If the lift on any lobe is below specified service limits, install a new camshaft and camshaft roller followers.
  8. Install the spark plugs. Refer to [Section 303-07](#) .
  9. Install the valve covers.
-

## Sprockets

1. Inspect the sprockets for cracks and worn or chipped teeth.

---

## Camshaft Bearing Journal Diameter

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure each camshaft journal diameter in 2 directions.

---

### Camshaft Journal to Bearing Clearance - OHC Engines

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** The camshaft journals must meet specifications before checking camshaft journal clearance.

Measure each camshaft bearing in 2 directions.

- Subtract the camshaft journal diameter from the camshaft bearing diameter.

---

**Camshaft End Play - OHC Engines**

## Special Tool(s)

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Using the Dial Indicator Gauge with Holding Fixture, measure the camshaft end play.
2. Position the camshaft to the rear of the cylinder head.
3. Zero the Dial Indicator Gauge.
4. Move the camshaft to the front of the cylinder head. Note and record the camshaft end play.
  - If camshaft end play exceeds specifications, install a new camshaft and recheck end play.
  - If camshaft end play exceeds specification after camshaft installation, install a new cylinder head.

## Camshaft Surface Inspection

1. Inspect camshaft lobes for pitting or damage in the contact area. Minor pitting is acceptable outside the contact area.

---

**Camshaft Lobe Lift**

## Special Tool(s)

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Use the Dial Indicator Gauge with Holding Fixture to measure camshaft intake/exhaust lobe lift.
  - Rotate the camshaft and subtract the lowest Dial Indicator Gauge reading from the highest Dial Indicator Gauge reading to figure the camshaft lobe lift.

## Camshaft Runout

### Special Tool(s)

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Camshaft journals must be within specifications before checking runout.

Using the Dial Indicator Gauge with Holding Fixture, measure the camshaft runout.

- Camshaft must be supported on the first and last camshaft bearing journal.
- Rotate the camshaft and subtract the lowest Dial Indicator Gauge reading from the highest Dial Indicator Gauge reading.

---

## Crankshaft Main Bearing Journal Diameter

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions.

---

### Crankshaft Main Bearing Journal Taper and Out-of-Round

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions at each end of the main bearing journal.

### Crankshaft Main Bearing Journal-to-Bearing Clearance

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

**NOTE:** Crankshaft main bearing journals must be within specifications before checking journal clearance.

1. Remove the crankshaft main bearing caps and crankshaft main bearing.
2. Lay a piece of Plastigage across the face of each crankshaft main bearing surface.

3. **NOTE:** Do not turn the crankshaft while carrying out this procedure.

Install and remove the crankshaft main bearing cap.

4. Verify the crankshaft journal clearance.

---

**Crankshaft End Play**

## Special Tool(s)

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Install the Dial Indicator Gauge with Holding Fixture.
2. Position the crankshaft to the rear of the cylinder block.
3. Zero the Dial Indicator Gauge.
4. Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.

## Connecting Rod Bearing Journal Taper and Out-of-Round

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure the crankshaft connecting rod journal diameters in 2 directions perpendicular to one another at each end of the connecting rod journal. The difference in the measurements from one end to the other is the taper. Verify measurement is within the wear limit.

---

**Cylinder Bore Taper**

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure the cylinder bore at the top, middle and bottom of piston ring travel in 2 directions as indicated. Verify the cylinder bore is within the wear limit. The difference indicates the cylinder bore taper. If the cylinder bore taper does not meet specification, bore the cylinder to the next oversize limit.

## Cylinder Bore Out-of-Round

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure the cylinder bore in 2 directions. The difference is the out-of-round.

## Piston Inspection

### Special Tool(s)

 <p>ST1279-A</p>	<p>Scraper, Piston Ring Groove 303-D033 (D81L-6002-D) or equivalent</p>
---	---

**NOTICE:** Do not use a caustic cleaning solution or a wire brush to clean the pistons or damage can occur.

1. Clean and inspect the (1) ring lands, (2) skirts, (3) pin bosses and the (4) tops of the pistons. If wear marks, scores or glazing is found on the piston skirt, check for a bent or twisted connecting rod.

2. Use the Piston Ring Groove Scraper to clean the piston ring grooves.
  - Make sure the oil ring holes are clean.

---

## Piston Pin Bore Diameter

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Piston and piston pins are a matched set and should not be interchanged.

Measure the piston pin bore diameter in 2 directions on each side. Verify the diameter is within specification.

---

## Piston Diameter

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure the piston diameter 90 degrees from the piston pin and 42 mm (1.65 in) down from the top of the piston at the point indicated.

## **Piston To Cylinder Bore Clearance**

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Subtract the piston diameter from the cylinder bore diameter to find the piston-to-cylinder bore clearance.
-

---

**Piston Selection**

**NOTE:** The cylinder bore must be within the specifications for taper and out-of-round before fitting a piston.

1. Select a piston size based on the cylinder bore.

2. **NOTE:** For precision fit, new pistons are divided into 3 categories within each size range based on their relative position within the range. A paint spot or specific size grade on a new piston indicates the position within the size range.

Choose the piston with the correct paint color or specific size grade.

- Refer to the appropriate section in Group 303 for the procedure.

---

**Piston Ring End Gap**

Special Tool(s)

	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent
---	--

**NOTICE:** Use care when fitting piston rings to avoid possible damage to the piston ring or the cylinder bore.

**NOTE:** Piston rings should not be transferred from one piston to another.

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

**NOTE:** The cylinder bore must be within specification for taper and out-of-round.

1. Use a piston without rings to push a piston ring in a cylinder to the bottom of ring travel.

2. Use the Feeler Gauge Set to measure the top piston ring end gap and the second piston ring end gap.

## Piston Ring-to-Groove Clearance

### Special Tool(s)

 <p>ST1271-A</p>	<p>Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent</p>
---	--

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Inspect the piston for ring land damage or accelerated wear.

2. Using the Feeler Gauge Set, measure the piston ring-to-groove clearance.

---

## Piston Pin Diameter

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure the piston pin diameter in 2 directions at the points shown. Verify the diameter is within specification.

---

## Connecting Rod Cleaning

**NOTICE:** Do not use a caustic cleaning solution or damage to connecting rods can occur.

1. **NOTE:** The connecting rod large end is a matched set. The connecting rod cap must be installed on the original connecting rod in the original position. Do not reverse the cap. Parts are not interchangeable.

Mark and separate the parts and clean with solvent. Clean the oil passages.

## Connecting Rod Large End Bore

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Tighten the bolts to specification, then measure the bore in 2 directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.

## Connecting Rod Bushing Diameter

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Use a telescoping gauge to determine the ID of the connecting rod bushing, if equipped.

2. Measure the telescoping gauge with a micrometer. Verify the diameter is within specification.

---

**Connecting Rod Bend**

## Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent
---	--

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Using the Feeler Gauge Set, measure the connecting rod bend on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the bend measurement is within specification.

---

**Connecting Rod Twist**

## Special Tool(s)

	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent
---	--

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Using the Feeler Gauge Set, measure the connecting rod twist on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the measurement is within specification.

---

**Connecting Rod Bearing Journal-to-Bearing Clearance**

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

**NOTE:** The crankshaft connecting rod journals must be within specifications to check the connecting rod bearing journal clearance.

1. Remove the connecting rod bearing cap.
2. Position a piece of Plastigage across the bearing surface.

3. **NOTE:** Do not turn the crankshaft during this step.

Install and tighten to specifications, then remove the connecting rod bearing cap.

4. Measure the Plastigage to get the connecting rod bearing journal clearance. The Plastigage should be smooth and flat. A changing width indicates a tapered or damaged connecting rod or connecting rod bearing.

---

**Connecting Rod to Crankshaft Side Clearance**

## Special Tool(s)

	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent
---	--

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Using the Feeler Gauge Set, measure the clearance between the connecting rod and the crankshaft.  
Verify the measurement is within specification.

## Roller Follower Inspection

1. Inspect the roller follower for flat spots or scoring. If any damage is found, inspect the camshaft lobes and hydraulic lash adjuster for damage.

### Hydraulic Lash Adjuster Inspection

1. Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage.

---

## Valve Stem Diameter

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

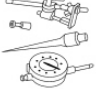

1. Measure the diameter of each intake and exhaust valve stem at the points shown. Verify the diameter is within specification.

---

**Valve Stem to Valve Guide Clearance**

## Special Tool(s)

 ST1251-A	Clearance Gauge, Valve Guide 303-004 (TOOL-6505-E) or equivalent
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

**NOTE:** The valve stem diameter must be within specifications before checking valve stem-to-valve guide clearance.

1. **NOTE:** If necessary, use a magnetic base.

Install a Valve Guide Clearance Gauge on the valve stem and install a Dial Indicator Gauge with Holding Fixture. Lower the valve until the clearance gauge contacts the upper surface of the valve guide.

2. Move the Valve Guide Clearance Gauge toward the Dial Indicator Gauge with Holding Fixture and zero the Dial Indicator Gauge. Move the Valve Guide Clearance Gauge away from the Dial Indicator Gauge with Holding Fixture and note the reading. The reading will be DOUBLE the valve stem-to-valve guide clearance.
-

---

## Valve Inspection

1. Inspect the following valve areas:
  1. The end of the stem for grooves or scoring.
  2. The valve face and the edge for pits, grooves or scores.
  3. The valve head for signs of burning, erosion, warpage and cracking.
  4. The valve margin for wear.

---

**Valve Guide Inner Diameter**

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Valve guides tend to wear in an hourglass pattern. The ball gauge can be inserted into the combustion chamber side of the valve guide, if necessary.

Use a ball gauge to determine the inside diameter of the valve guides in 2 directions at the top, middle and bottom of the valve guide.

2. Measure the ball gauge with a micrometer.

3. If the valve guide is not within specifications, install a new cylinder head assembly.
-

### Valve Spring Installed Length

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure the installed length of each valve spring.

## Valve Spring Free Length

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure the free length of each valve spring.

## Valve Spring Squareness

1. Measure the out-of-square on each valve spring.
  - Turn the valve spring and observe the space between the top of the valve spring and the square.

## Valve Spring Strength

### Special Tool(s)

 <p>ST1278-A</p>	<p>Pressure Gauge, Valve/Clutch Spring 303-006 (TOOL-6513-DD) or equivalent</p>
---	---

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Use the Valve/Clutch Spring Pressure Gauge to check the valve spring for correct strength at the specified valve spring length.

## Valve Seat Inspection

### Valve and Seat Refacing Measurements

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

**NOTE:** After grinding valves or valve seats, check valve clearance.

1. Check the valve head and seat.
  - Check valve angles.
  - Check margin width.
  - Be sure margin width is within specification.

2. Inspect for abnormalities on the valve face and seat. Install a new cylinder head assembly if abnormalities are found.
-

## Valve Seat Width

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Measure the valve seat width. If necessary, grind the valve seat to specification.
  - Measure the intake valve seat width.
  - Measure the exhaust valve seat width.
  - Recheck the valve spring installed length after the seats have been ground, and shim the valve springs as necessary to achieve the correct installed spring length.
  - Depending on the engine, check the valve lash. Refer to General Procedures in Section 303-01.

## Valve Seat Runout

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. Use a valve seat runout gauge to check valve seat runout.

---

**Cylinder Block Distortion**

## Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent
---	--

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

Use a Straightedge and a Feeler Gauge Set to inspect the cylinder block for flatness.

**Cylinder Head Distortion**

## Special Tool(s)

	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent
---	--

**NOTE:** Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, silicone sealant, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

**NOTE:** Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

Using a Straightedge and a Feeler Gauge Set, inspect the cylinder head for flatness in the sequence shown.

---

**Cylinder Bore Cleaning**

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

1. **NOTICE:** If these procedures are not followed, rusting of the cylinder bores may occur.

Clean the cylinder bores with soap or detergent and water.

2. Thoroughly rinse with clean water and wipe dry with a clean, lint-free cloth.
  3. Use a clean, lint-free cloth and lubricate the cylinder bores.
    - Use clean engine oil meeting Ford specification.
-

**Core Plug Replacement**

## Special Tool(s)

 ST1195-A	Slide Hammer 100-001 (T50T-100-A)
---	--------------------------------------

## Material

Item	Specification
High Temperature Retaining Compound Loctite® 620TM/Permatex® 62050, or equivalent; obtain locally	WSK-M2G349-A9
Threadlock 262 TA-26	WSK-M2G351-A6

**NOTICE:** It is necessary to use High Temperature Retaining Compound Loctite® 620TM/Permatex® 62050 or equivalent on all 3 valve modular engine cylinder head cup plugs. If not used, the cylinder head cup plugs could leak or seep, causing serious engine damage.

**NOTE:** Use threadlock 262 on all other applications.

**All core plugs**

1. **NOTE:** Cylinder block core plug shown, cylinder head core plug similar.

Use the Slide Hammer and a freeze plug remover to remove the core plug.

2. **NOTE:** Oversize plugs are identified by the OS stamped in the flat located on the cup side of the plug.

Inspect the core plug bore for any damage that would interfere with the correct sealing of the plug. If the core plug bore is damaged, bore for the next oversize plug.

**Cup-type**

3. **NOTICE:** Use care during this procedure so as not to disturb or distort the cup sealing surface.

**NOTE:** When installed, the flanged edge must be below the chamfered edge of the bore to effectively seal the bore.

Coat the cup-type core plug and bore lightly with sealant and install the core plug using a freeze plug installer.

### Expansion-type

4. **NOTICE:** Do not contact the crown when installing an expansion-type core plug. This could expand the plug before seating and result in leakage.

Coat the expansion-type core plug and bore lightly with sealant and install the core plug using a freeze plug installer.

## Spark Plug Inspection

1. Inspect the spark plug for a bridged gap.
  - Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.
  - Install a new spark plug.

2. Check for oil fouling.
  - Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.
  - Correct the oil leak concern.
  - Install a new spark plug.

3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
  - Install new spark plugs.

4. Inspect for normal burning.
  - Check for light tan or gray deposits on the firing tip.

5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a heli-coil insert in place of the spark plug threads.

- Install a new spark plug.

6. Inspect for overheating, identified by white or light gray spots and a bluish-burnt appearance of electrodes. This is caused by engine overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing.

- Install a new spark plug.

7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.

- Install new spark plugs.

---

**Exhaust Manifold Cleaning and Inspection**

## Special Tool(s)

	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent
---	--

1. Clean the exhaust manifold using a suitable solvent. Use a plastic scraping tool to clean the gasket sealing surfaces.
2. **NOTE:** New exhaust manifold gaskets, studs, nuts and/or bolts must be installed when an exhaust manifold is serviced.

**NOTE:** Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

Using the Straightedge and a Feeler Gauge Set, check the exhaust manifold sealing surface for warpage. If the warpage is greater than 0.76 mm (0.0299 in), install a new exhaust manifold.

## Bearing Inspection

1. Inspect bearings for the following defects:
  1. Cratering - fatigue failure
  2. Spot polishing - incorrect seating
  3. Imbedded dirty engine oil
  4. Scratching - dirty engine oil
  5. Base exposed - poor lubrication
  6. Both edges worn - journal damaged
  7. One edge worn - journal tapered or bearing not seated

## Flexplate Inspection

1. Inspect the flexplate for:
  1. any cracks.
  2. worn ring gear teeth.
  3. chipped or cracked ring gear teeth.

## Powertrain/Drivetrain Mount Neutralizing

**NOTE:** Refer to the appropriate section and procedure for special instructions on loosening and tightening mount fasteners.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A .
2. Loosen, but do not remove, the powertrain/drivetrain mount fasteners.
3. Lower the vehicle.
4. **NOTICE: Do not twist or strain the powertrain/drivetrain mounts or damage to the mounts may occur.**

Start the vehicle and move it in forward 0.6-1.2 m (2-4 ft). Then move the vehicle in reverse the same distance.

5. Raise and support the vehicle.
  6. Tighten the powertrain/drivetrain mount fasteners.
  7. Lower the vehicle.
  8. Test the system for normal operation.
-

## General Specifications

Item	Specification
<b>Engine</b>	
Displacement	4.6L (281 CID) (2V)
No. cylinders	8
Bore	90.2 mm (3.5512 in)
Stroke	90 mm (3.5433 in)

Firing order	1-3-7-2-6-5-4-8
Oil pressure hot @ 2,500 rpm	40-70 psi
Compression ratio	9.37:1
Engine weight (without accessory drive components and flexplate)	233.1 kg (514 lb)
<b>Cylinder Head and Valve Train</b>	
Combustion chamber volume	43.95 ± 1.5 cc (2.68 ± 0.092 ci)
Valve arrangement (front to rear) LH	EIEIEIEI
Valve arrangement (front to rear) RH	IEIEIEIE
Valve guide bore diameter	7.044-7.015 mm (0.2773-0.2762 in)
Valve stem diameter (intake)	6.995-6.975 mm (0.2753-0.2746 in)
Valve stem diameter (exhaust)	6.970-6.949 mm (0.2744-0.2735 in)
Valve stem-to-guide clearance (intake)	0.069-0.020 mm (0.0027-0.0007 in)
Valve stem-to-guide clearance (exhaust)	0.095-0.046 mm (0.0037-0.0018 in)
Valve head diameter (intake)	44.6 mm (1.7559 in)
Valve head diameter (exhaust)	36.1 mm (1.4212 in)
Valve face runout limit	0.05 mm (0.0019 in)
Valve face angle	45.5°
Valve seat width (intake)	2.1-1.9 mm (0.0827-0.0748 in)
Valve seat width (exhaust)	2.1-1.9 mm (0.0827-0.0748 in)
Valve seat runout Total Indicated Runout (TIR)	0.025 mm (0.0009 in)
Valve seat angle	45.00°
Valve spring free length (intake)	50.2 mm (1.9763 in)
Valve spring free length (exhaust)	50.2 mm (1.9763 in)
Valve spring out-of-square limit (intake)	2.5°
Valve spring out-of-square limit (exhaust)	2.5°
Valve spring compression pressure (intake)	633.3-701.3 N @ 28.02 mm (1.1031 in)
Valve spring compression pressure (exhaust)	633.3-701.3 N @ 28.02 mm (1.1031 in)
Valve spring installed height (intake)	40.6-43.6 mm (1.5984-1.7165 in)
Valve spring installed height (exhaust)	40.6-43.6 mm (1.5984-1.7165 in)
Valve spring installed pressure (intake)	272.1-306.1 N @ 40.0 mm (1.5748 in)
Valve spring installed pressure (exhaust)	272.1-306.1 N @ 40.0 mm (1.5748 in)
Valve spring installed pressure service limit (intake)	274.6 N @ 40.01 mm (1.5752 in)
Valve spring installed pressure service limit (exhaust)	274.6 N @ 40-01 mm (1.5752 in)
Roller follower ratio	1.75:1
Head gasket surface flatness	0.025 mm (0.001 in) in any 25 mm (1 in) x 25 mm (1 in) area; 0.050 mm (0.002 in) in any 150 mm (6 in) x 150 mm (6 in) area; 0.1 mm (0.004 in) overall
<b>Hydraulic Lash Adjuster</b>	
Diameter	15.988-16.00 mm (0.6294-0.6299 in)

Clearance to bore	0.018-0.069 mm (0.0007-0.0027 in)
Service limit	0.016 mm (0.0006 in)
Hydraulic leakdown rate	5-25 seconds
Collapsed lash adjuster gap	0.45-0.85 mm (0.0177-0.0334 in)
<b>Camshaft</b>	
Theoretical valve lift @ zero lash (intake)	12.0 mm (0.4724 in)
Theoretical valve lift @ zero lash (exhaust)	12.0 mm (0.4724 in)
Lobe lift (exhaust) (LH)	7.4974 mm (0.2951 in)
Lobe lift (exhaust) (RH)	7.4979 mm (0.2952 in)
Lobe lift (intake)	7.1103 mm (0.2799 in)
Allowable lobe lift loss	0
Journal diameter	26.96-26.93 mm (1.0615-1.0605 in)
Journal bore inside diameter (cap assembled)	27.01-26.99 mm (1.0635-1.0625 in)
Camshaft journal-to-bearing clearance	0.076-0.025 mm (0.0030-0.0010 in)
Runout: Full indicator measurement on all journals when supported on front and rear journal	0.09 mm (0.0035 in) (4 places)
Camshaft end play	0.03-0.19 mm (0.0011-0.0075 in)
<b>Cylinder Block</b>	
Cylinder bore diameter	90.200-90.213 (Grade 1)
Cylinder bore diameter	90.213-90.226 (Grade 2)
Cylinder bore diameter	90.226-90.239 (Grade 3)
Cylinder bore maximum taper	0.013 mm (0.00051 in)
Cylinder bore maximum out-of-round	0.015 mm (0.00059 in)
Main bearing bore inside diameter	72.40-72.424 mm (2.8504-2.8513 in)
Head gasket surface flatness	0.03 mm (0.001 in) in any 40 mm (1.5 in) x 40 mm (1.5 in) area; 0.05 mm (0.002 in) in any 150 mm (6 in) x 150 mm (6 in) area; 0.15 mm (0.006 in) overall
<b>Crankshaft</b>	
Main bearing journal diameter	67.483-67.503 mm (2.6568-2.6576 in)
Main bearing journal maximum taper	0.004 mm (0.0002 in)
Main bearing journal maximum-out-of-round	0.0075 mm (0.0003 in) between cross sections
Main bearing journal-to-cylinder block clearance	0.066-0.024 mm (0.0259-0.0009 in)
Connecting rod journal diameter	53.003-52.983 mm (2.0867-2.0859 in)
Connecting rod journal maximum taper (straightness)	0.004 mm (0.0002 in)
Connecting rod journal maximum-out-of-round	0.0075 mm (0.0003 in) between cross sections
Crankshaft maximum end play	0.301 mm (0.0118 in)
<b>Piston and Connecting Rod</b>	
Piston diameter	
Grade 1	90.191-90.206 mm (3.5508-3.5514 in)
Grade 2	90.203-90.220 mm (3.5513-3.5519 in)
Grade 3	90.217-90.232 mm (3.5518-3.5524 in)

Piston-to-cylinder bore clearance (at grade size)	0.017-0.047 mm (0.0007-0.0019 in)
Piston ring end gap (top)	0.15-0.30 mm (0.0059-0.0118 in)
Piston ring end gap (intermediate)	0.15-0.30 mm (0.0059-0.0118 in)
Piston ring end gap (oil control)	0.15-0.30 mm (0.0059-0.0118 in)
Ring groove width (top)	1.520-1.540 mm (0.0598-0.0606 in)
Ring groove width (intermediate)	1.520-1.540 mm (0.0598-0.0606 in)
Ring groove width (oil control)	3.03-3.055 mm (0.1193-0.1203 in)
Piston ring width (top)	1.5 mm (0.05 in)
Piston ring width (intermediate)	1.5 mm (0.05 in)
Piston ring-to-groove clearance (top)	0.020-0.060 mm (0.0008-0.0024 in)
Piston ring-to-groove clearance (intermediate)	0.020-0.060 mm (0.0008-0.0023 in)
Piston ring-to-groove clearance (oil control)	0.030-0.070 mm (0.0012-0.0028 in)
Piston pin bore diameter	22.0065-22.0110 mm (0.8664-0.8666 in)
Piston pin diameter	21.995-21.997 mm (0.8659-0.8660 in)
Piston pin length	61.870-62.120 mm (2.4358-2.4456 in)
Piston pin-to-piston fit	0.0095-0.016 mm (0.0004-0.0006 in)
Piston-to-connecting rod clearance	6.58-7.58 mm (0.259-0.298 in)
Connecting rod-to-pin clearance	0.016-0.038 mm (0.0006-0.0015 in)
Connecting rod pin bore diameter	22.02-22.01 mm (0.8671-0.8666 in)
Connecting rod length (centerline bore-to-bore)	150.7 mm (5.9330 in)
Connecting rod maximum allowable bend	±0.038 mm (0.0015 in)
Connecting rod maximum allowable twist	±0.05 mm (0.0019 in)
Connecting rod bearing bore diameter	56.86-56.89 mm (2.2388-2.2396 in)
Connecting rod bearing-to-crankshaft clearance	0.06-0.02 mm (0.0026-0.0010 in)
Connecting rod side clearance (standard)	0.015-0.45 mm (0.0006-0.0177 in)
Connecting rod side clearance (maximum)	0.50 mm (0.0197 in)

## Engine

**NOTE:** For information, refer to the exploded view under the Assembly procedure in this section.

The 4.6L (281 CID) is a V-8 engine with the following features:

- Single overhead camshafts
- Two valves per cylinder
- Sequential Multi-Port Fuel Injection (SFI)
- Aluminum cylinder heads
- Cast iron, 90-degree V-cylinder block
- Individually chain-driven camshafts with a hydraulic timing chain tensioner on each timing chain
- Electronic ignition system with 8 ignition coils
- Electronic returnless fuel system

## Engine Identification

Always refer to these labels when installation of new parts is necessary or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure that the correct parts are obtained. These codes contain all the pertinent information relating to the dates, optional equipment and revisions.

### Engine Code Information Label

The engine code information label, located on the side of the valve cover, contains the following:

Item	Description
1	Bar code
2	Engine plant (Romeo)
3	Engine displacement
4	Engine build date (DDMMYY)
5	Running number
6	Bar code
7	Plant shift line
8	Engine part number

## Engine Cylinder Identification

## Exhaust Emission Control System

Operation and necessary maintenance of the exhaust emission control devices used on this engine are covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

## Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 8 solenoid-operated fuel injectors:

- are mounted in the intake manifold.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.
- are connected in series with the fuel pressure sensor.

A constant fuel pressure is maintained across the fuel injectors by the fuel pressure sensor. The fuel pressure sensor:

- is positioned upstream from the fuel injectors on the fuel rail.

## Valve Train

The valve train operates as follows:

- Ball-tip hydraulic lash adjusters provide automatic lash adjustment.
- Roller followers ride on the camshaft lobe, transferring the up-and-down motion of the camshafts to the valves in the cylinder heads.

## PCV System

All engines are equipped with a closed-type PCV system recycling the crankcase vapors to the upper intake manifold.

## Lubrication System

The engine lubrication system operates as follows:

- Oil is drawn into the oil pump through the oil pump screen cover and tube in the sump of the oil pan.
- Oil is pumped through the oil filter on the left front side of the cylinder block.
- Oil enters the main gallery where it is distributed to the crankshaft main journals and to both cylinder heads.
- From the main journals, the oil is routed through cross-drilled passages in the crankshaft to lubricate the connecting rod bearings. Controlled leakage through the crankshaft main bearings and connecting rod bearings is slung radially outward to cool and lubricate the cylinder walls as well as the entire connecting rod, piston and piston ring assembly.
- The left cylinder head is fed from a drilling into the supply passage feeding the main gallery at the front of the cylinder block. The right cylinder head is fed from a drilling into the rear of the main gallery. Main gallery pressure is reduced as it enters the cylinder head galleries through fixed serviceable orifices, located at the upper part of the feed passages. It is this reduced pressure in the cylinder head galleries which feeds the camshaft journals, the hydraulic lash adjusters and the primary and secondary timing chain tensioners.
- The camshaft lobe and roller followers are lubricated by splash created through valve train operation.

## Oil Pump

The lubrication system of the 4.6L (2V) engine is designed to provide optimum oil flow to critical components of the engine through its entire operating range. The heart of the system is a positive displacement internal gear oil pump using top seal rotors. Generically this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
  - The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
  - System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
  - Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure, both at hot idle and maximum speed.
  - The relief valve calibration protects the system from excessive pressure during high viscosity conditions.
  - The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.
-

## **Engine**

Refer to Section 303-00 for basic mechanical concerns or refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

### Removal

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Disconnect the fuel tube spring lock coupling. For additional information, refer to [Section 310-00](#) .
3. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#) .
4. Drain the engine cooling system. For additional information, refer to [Section 303-03](#) .
5. Remove the Air Cleaner (ACL) and outlet pipe. For additional information, refer to [Section 303-12](#) .
6. Remove the wiper mounting arm and pivot shaft. For additional information, refer to [Section 501-16](#) .
7. Disconnect the 8 fuel injector electrical connectors.
8. Remove the 8 ignition coil-on-plugs. For additional information, refer to [Section 303-07](#) .
9. Remove the 2 bolts and the intake manifold shield.
10. Disconnect the brake booster vacuum hose from the intake manifold.
11. Disconnect the quick connect coupling Evaporative Emission (EVAP) canister purge valve hoses

from the Throttle Body (TB) spacer and from the EVAP canister purge valve. For additional information, refer to [Section 310-00](#).

12. Disconnect the quick connect coupling PCV tube from the TB spacer. For additional information, refer to [Section 310-00](#).
13. Disconnect the EGR system module vacuum and electrical connectors.
14. Disconnect the intake manifold-to- TB spacer vacuum hose.
15. Disconnect the generator electrical connector.
16. Detach the 2 generator wiring harness retainers from the generator bracket.
17. Remove the 4 generator bracket bolts and the bracket.
18. Remove the coolant thermostat. For additional information, refer to [Section 303-03](#).
19. Disconnect the throttle control and the Throttle Position (TP) sensor electrical connectors.
20. Release the heater hose spring clamp and disconnect the heater hose.
21. Remove the EGR system module tube. For additional information, refer to [Section 303-08](#).
22. If equipped, detach the wire harness retainer from the intake manifold crash bracket.
23. Remove the intake manifold crash bracket bolt and prevent the bolt from contacting the cylinder head with a rubber band or tie strap.

24. Remove the intake manifold crash bracket bolt.
25. Disconnect the fuel rail pressure and temperature sensor vacuum and electrical connectors.
26. Remove the wire harness retainer from the rear of the intake manifold.
27. Remove the 8 bolts and the intake manifold.
  - Remove and discard the intake manifold gaskets.
28. Clean the sealing surfaces.

## Installation

1. **NOTE:** Align the gasket locator tabs with the slots in the cylinder head.

Install new intake manifold gaskets.

2. Install the intake manifold and hand-tighten the 8 bolts.
3. Install the 8 ignition coil-on-plugs. For additional information, refer to [Section 303-07](#).
4. Position the intake manifold crash bracket and loosely install the bolt and stud bolt.
5. Tighten the bolts in the sequence shown.
  - Tighten to 25 Nm (18 lb-ft).

6. Tighten the intake manifold crash bracket bolt.
  - Tighten to 25 Nm (18 lb-ft).
7. Install the EGR system module tube. For additional information, refer to [Section 303-08](#).
8. Install the intake manifold shield and the 2 bolts.
  - Tighten to 10 Nm (89 lb-in).
9. Connect the throttle control and the TP sensor electrical connectors.
10. Install the coolant thermostat. For additional information, refer to [Section 303-03](#).
11. Install the generator bracket and the 4 bracket bolts.
  - Tighten to 10 Nm (89 lb-in).
12. Connect the generator electrical connector.
13. Attach the 2 generator wiring harness retainers to the generator bracket.
14. Connect the EVAP canister purge valve hoses to the TB and the EVAP canister purge valve. For additional information, refer to [Section 310-00](#).
15. Connect the intake manifold vacuum hose to the TB spacer.

16. Connect the EGR system module vacuum and electrical connectors.
17. Connect the PCV tube quick connect coupling to the TB spacer. For additional information, refer to Section 310-00 .
18. Connect the brake booster vacuum hose to the intake manifold.
19. Install the heater hose and spring clamp.
20. Connect the fuel rail pressure and temperature sensor vacuum and electrical connectors.
21. Connect the 8 fuel injector electrical connectors.
22. Install the wire harness retainer to the rear of the intake manifold.
23. If equipped, attach the wire harness retainer to the intake manifold crash bracket.
24. Install the wiper mounting arm and pivot shaft. For additional information, refer to Section 501-16 .
25. Connect the fuel spring lock coupling. For additional information, refer to Section 310-00 .
26. Install the ACL and outlet pipe. For additional information, refer to Section 303-12 .
27. Connect the battery ground cable. For additional information, refer to Section 414-01 .
28. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .
29.  **WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

---

**Valve Cover - RH**

## Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Silicone Gasket Remover ZC-30	-

**Valve Cover - RH (View 1 of 4)**

Item	Part Number	Description
1	14A464	Crankshaft Position (CKP) sensor electrical connector (part of 12B637)
2	14A464	A/C compressor electrical connector (part of 12B637)

**Valve Cover - RH (View 2 of 4)**

Item	Part Number	Description
1	14A464	A/C pressure sensor electrical connector (part of 12B637)
2	14A464	Electronic engine control electrical connector (part of 12B637)
3	14A464	A/C accumulator switch electrical connector (part of 12B637)

#### Valve Cover - RH (View 3 of 4)

Item	Part Number	Description
1	6K817	PCV tube
2	14A464	Ignition coil electrical connector (part of 12B637) (4 required)
3	14A163	Engine wire harness retainer (part of 12B637) (3 required)

## Valve Cover - RH (View 4 of 4)

Item	Part Number	Description
1	N806183	RH valve cover bolt (3 required)
2	W705644	RH valve cover stud bolt (8 required)
3	6582	RH valve cover
4	6584	RH valve cover gasket

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Disconnect the fuel tube spring lock coupling. For additional information, refer to [Section 310-00](#) .
3. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#) .
4. Remove the LH engine mount. For additional information, refer to [Engine Mount - LH](#) in this section.
5. Remove the Evaporative Emission (EVAP) canister purge valve. For additional information, refer to [Section 303-13](#) .
6. Disconnect the Crankshaft Position (CKP) sensor electrical connector.
7. Disconnect the A/C compressor electrical connector.
8. Disconnect the A/C pressure sensor electrical connector.
9. Disconnect the electronic engine control electrical connector.
10. Disconnect the A/C accumulator switch electrical connector.
11. Disconnect the PCV tube quick connect coupling from the PCV valve. For additional information, refer to [Section 310-00](#) .
12. Disconnect the 4 RH ignition coil electrical connectors.

13. Disconnect the 3 wire harness retainers from the valve cover and position wire harness aside.
14. Lower the engine.
15. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surface. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the gasket material.

Loosen the 8 studs, the 3 bolts and remove the valve cover and discard the gasket.

- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

## Installation

1. **NOTICE:** If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

Apply a bead of silicone gasket and sealant in 2 locations shown where the engine front cover meets the cylinder head.

2. Install a new valve cover gasket and the valve cover.
  - Tighten the fasteners in the sequence shown to 10 Nm (89 lb-in).

3. Raise the engine.
4. Position wire harness and connect the 3 wire harness retainers to the valve cover.
5. Connect the 4 RH ignition coil electrical connectors.
6. Connect the PCV tube quick connect coupling to the PCV valve. For additional information, refer to Section 310-00.
7. Connect the A/C accumulator switch electrical connector.

8. Connect the 3 electronic engine control electrical connectors.
9. Connect the A/C pressure sensor electrical connector.
10. Connect the A/C compressor electrical connector.
11. Connect the CKP sensor electrical connector.
12. Install the EVAP canister purge valve. For additional information, refer to Section 303-13 .
13. Install the LH engine mount. For additional information, refer to Engine Mount - LH in this section.
14. Connect the fuel tube spring lock coupling. For additional information, refer to Section 310-00 .
15. Connect the battery ground cable. For additional information, refer to Section 414-01 .
16.  **WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

**Valve Cover - LH**

## Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Silicone Gasket Remover ZC-30	-

Item	Part Number	Description
1	13A506	Wire harness retainer (part of 12B637) (4 required)
2	6758	Crankcase ventilation tube
3	W705644	Valve cover stud bolt (5 required)
4	N806183	Valve cover bolt (6 required)
5	W705787	Valve cover bolt
6	6A505	LH valve cover
7	6A559	LH valve cover gasket

**Removal**

1. Remove the Air Cleaner (ACL) and outlet pipe. For additional information, refer to [Section 303-12](#) .
2. Disconnect the 4 wiring harness retainers from the valve cover and position the wire harness aside.
3. Disconnect the crankcase ventilation tube quick connect coupling from the valve cover. For additional information, refer to [Section 310-00](#) .
4. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surface. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the gasket material.

Loosen the 11 fasteners and remove the LH valve cover and gasket.

- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

## Installation

1. **NOTICE:** If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

Apply a bead of silicone gasket and sealant in 2 locations shown where the engine front cover meets the cylinder head.

2. Position the LH valve cover and new gasket on the cylinder head.
  - Tighten the fasteners in the sequence shown to 10 Nm (89 lb-in).

3. Connect the crankcase ventilation tube quick connect coupling to the valve cover. For additional information, refer to [Section 310-00](#).
  4. Position the wire harness and connect the 4 wiring harness retainers to the valve cover.
  5. Install the ACL and outlet pipe. For additional information, refer to [Section 303-12](#).
-

**Lower End Components - Exploded View, Crankshaft Pulley and Crankshaft Front Seal**

Item	Part Number	Description
1	8620	Accessory drive belt
2	W701512	Crankshaft pulley bolt
3	N806165	Crankshaft pulley bolt washer
4	6316	Crankshaft pulley
5	6700	Crankshaft front seal

1. For additional information, refer to the procedures in this section.

## Crankshaft Pulley

### Special Tool(s)

 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent

### Material

Item	Specification
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

### Removal

1. Remove the engine cooling fan motor and shroud. For additional information, refer to [Section 303-03](#).
2. Rotate the tensioner clockwise and remove the accessory drive belt.

3. Remove the crankshaft pulley bolt.

4. Using the Crankshaft Vibration Damper Remover, remove the crankshaft pulley.

## Installation

1. **NOTE:** The crankshaft pulley must be installed within 4 minutes after applying the silicone.

Apply sealant to the Woodruff key slot on the crankshaft pulley.

2. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

3. **NOTE:** Use the Strap Wrench to hold the crankshaft pulley.

Install the bolt and washer. Tighten the bolt in 4 steps.

- Step 1: Tighten to 120 Nm (89 lb-ft).
- Step 2: Loosen the bolt one full turn.
- Step 3: Tighten to 50 Nm (37 lb-ft).
- Step 4: Tighten an additional 90 degrees.

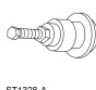

4. Rotate the tensioner clockwise and install the accessory drive belt.

5. Install the engine cooling fan motor and shroud. For additional information, refer to Section 303-03 .
-

**Crankshaft Front Seal****Special Tool(s)**

 ST2197-A	Installer, Crankshaft Front Oil Seal 303-635
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A)
 ST1288-A	Remover, Crankshaft Front Oil Seal 303-107 (T74P-6700-A)

**Material**

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**Removal**

1. Remove the crankshaft pulley. For additional information, refer to [Crankshaft Pulley](#) in this section.
2. Using the Crankshaft Front Oil Seal Remover, remove the crankshaft front seal.

**Installation**

1. Lubricate the engine front cover and the crankshaft front seal inner lip with clean engine oil.

2. Using the Crankshaft Front Oil Seal Installer, Crankshaft Vibration Damper Installer and Front Cover Oil Seal Installer, install the crankshaft front seal into the engine front cover.

3. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
-

**Engine Front Cover**

## Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Silicone Gasket Remover ZC-30	-

**Engine Front Cover (View 1 of 2)**

Item	Part Number	Description
1	W500315	Power steering pump bolt (3 required)
2	3A674	Power steering pump assembly

3	6730	Oil pan drain plug
4	W701605	Oil pan bolt (4 required)
5	W701725	Shield bolt
6	9G609	Shield
7	N808102	Accessory drive idler pulley bolt
8	19A216	Accessory drive idler pulley

**Engine Front Cover (View 2 of 2)**

Item	Part Number	Description
1	N806177	Engine front cover bolt (8 required)
2	N806300	Engine front cover stud bolt (5 required)
3	W706508	Engine front cover bolt
4	N808586	Engine front cover bolt
5	6D080	Engine front cover
6	6D081	Engine front cover gasket (3 required)

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove both valve covers. For additional information, refer to [Valve Cover - RH](#) or [Valve Cover - LH](#) in this section.
3. Remove the coolant pump. For additional information, refer to [Section 303-03](#) .
4. Remove the crankshaft front seal. For additional information, refer to [Crankshaft Front Seal](#) in this section.
5. Remove the 3 bolts and position the power steering pump aside.

6. Drain the engine oil.
  - Install the drain plug when finished.
  - Tighten to 23 Nm (17 lb-ft).
7. Remove the 4 front oil pan-to-engine front cover bolts.
8. Remove the bolt and the shield.
9. Remove the bolt and the accessory drive idler pulley.
10. Remove the bolts and the stud bolts in the sequence shown.

11. Remove the engine front cover from the front cover-to-cylinder block dowel.

12. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surface. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the gasket material.

Clean the gasket surfaces with a plastic scraping tool and metal surface prep.

## Installation

1. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply silicone gasket and sealant along the cylinder head-to-block surface and the oil pan-to-cylinder block surface.

2. Position the new engine front cover gaskets.

3. Install the engine front cover on the front cover-to-cylinder block dowel and loosely install the bolts.

4. Tighten the front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).

Item	Part Number	Description
1	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
2	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
3	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
4	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
5	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
6	W706508	Stud, hex-head pilot, M8 x 1.25 x 50 - M6 x 1 x 10
7	N808586	Stud, washer hex-head pilot, M8 x 1.25 - M6 x 1.0 x 86.35
8	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
9	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
10	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
11	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
12	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
13	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
14	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
15	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1

5. Install the accessory drive idler pulley and the bolt.
  - Tighten to 25 Nm (18 lb-ft).

6. Install the shield and the bolts.
  - Tighten to 25 Nm (18 lb-ft).

7. Loosely install the 4 front oil pan bolts.

8. **NOTE:** Make sure to tighten the bolts in 2 stages.

Tighten the 4 front oil pan bolts in 2 stages.

- Stage 1: Tighten to 20 Nm (177 lb-in).
- Stage 2: Tighten an additional 60 degrees.

9. **NOTE:** The front lower hole in the power steering pump is not used.

Position the power steering pump and install the 3 bolts.

- Tighten to 25 Nm (18 lb-ft).

10. Install a new crankshaft front seal. For additional information, refer to Crankshaft Front Seal in this section.

11. Install the coolant pump. For additional information, refer to Section 303-03.

12. Install the valve covers. For additional information, refer to Valve Cover - RH or Valve Cover - LH in this section.

13. Fill the engine with clean engine oil.

14. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B. Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

**Timing Drive Components**

## Special Tool(s)

	Aligner, Camshaft Position 303-557 (T96T-6256-B)
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1330-A	Compressor, Valve Spring 303-581 (T97T-6565-A)
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)

## General Equipment

Hydraulic Chain Tensioner Clip - 1L3Z-6P250-AA

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**Removal**

**NOTICE:** Since the engine is not free-wheeling, timing procedures must be followed exactly or piston and valve damage can occur.

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the engine front cover. For additional information, refer to [Engine Front Cover](#) in this section.
3. Remove the crankshaft sensor ring from the crankshaft.

4. Disconnect the 8 ignition coil electrical connectors (4 shown).

5. Remove the bolts and the 8 ignition coils (4 shown).

6. **NOTICE:** Only use hand tools when removing or installing the spark plugs, damage may occur to the cylinder head or spark plug.

**NOTE:** Use compressed air to remove any foreign material from the spark plug wells before removing the spark plugs.

Remove the 8 spark plugs.

7. Position the lobe of the camshaft up.

8. Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

9. **NOTICE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.

Using the Valve Spring Compressor, compress the valve spring and remove the camshaft roller followers.

10. Position the crankshaft with the keyway at the 12 o'clock position.

11. **NOTE:** LH shown, RH similar.

Remove the timing chain tensioning system from both timing chains.

1. Remove the bolts.
2. Remove the timing chain tensioners.
3. Remove the timing chain tensioner arms.

12. Remove the LH and RH timing chains and the crankshaft sprocket.
- Remove the RH timing chain from the camshaft sprocket.
  - Remove the RH timing chain from the crankshaft sprocket.
  - Repeat for the LH timing chain and crankshaft sprocket.

13. Remove the timing chain guides.

1. Remove the bolts.
2. Remove the LH timing chain guide.
3. Remove the bolts.
4. Remove the RH timing chain guide.

14. **NOTE:** RH shown, LH similar.

Install the Camshaft Position Aligner.

15. **NOTE:** RH shown, LH similar.

Remove the bolt and the camshaft gear.

## Installation

### Engines with ratcheting timing chain tensioners

1. **NOTICE:** Timing chain procedure must be followed exactly or damage to valves and pistons will result.

**NOTICE:** Do not compress the ratchet assembly. This will damage the ratchet assembly.

**NOTE:** LH shown, RH similar.

Compress each tensioner plunger, using an edge of a vise.

2. Using a small screwdriver or pick, push back and hold the ratchet mechanism.

3. While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

4. Install a paper clip into the hole of each tensioner housing to hold the ratchet assembly and plunger in during installation.
  - Remove the tensioner from the vise.

### Engines with non-ratcheting timing chain tensioners

5. **NOTICE:** If one or both tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner or engine damage may occur.

Inspect the RH and LH timing chain tensioners.

- Install new tensioners as necessary.

6. **NOTICE:** The timing chain procedure must be followed exactly or damage to valves and pistons will result.

**NOTE:** LH shown, RH similar.

Compress each tensioner plunger, using a vise.

7. Install a Hydraulic Chain Tensioner Retaining Clip on each tensioner to hold the plunger in during installation.

### All engines

8. If the colored links are not visible, mark one link on one end and one link on the other end, and use as timing marks.

9. Install the camshaft sprockets and new bolts. Tighten the bolts in 2 stages.

- Stage 1: Tighten to 40 Nm (30 lb-ft).
- Stage 2: Tighten an additional 90 degrees (one-fourth turn).

10. Using the Crankshaft Holding Tool, position the crankshaft so the No. 1 cylinder is at Top Dead Center (TDC).

11. Install the crankshaft sprocket, making sure the flange faces forward.

12. Install the timing chain guide.

1. Position the LH timing chain guide.
2. Install and tighten the LH bolts to 10 Nm (89 lb-in).
3. Position the RH timing chain guide.
4. Install and tighten the RH bolts to 10 Nm (89 lb-in).

13. Rotate the RH camshaft sprocket until the timing mark is approximately at the 11 o'clock position.  
Rotate the LH camshaft sprocket until the timing mark is approximately at the 1 o'clock position.

14. Position the LH (inner) timing chain on the crankshaft sprocket, aligning the colored (marked) link with the timing mark on the sprocket.

15. Install the LH timing chain on the sprocket, aligning the colored (marked) link with the timing marks on the sprocket.

16. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner.

- Tighten to 25 Nm (18 lb-ft).

### Engines with ratcheting timing chain tensioners

17. Remove the paper clip from the LH timing chain tensioner.

### Engines with non-ratcheting timing chain tensioners

18. Remove the Hydraulic Chain Tensioner Retaining Clip from the LH timing chain tensioner.

### All engines

19. Position the RH (outer) timing chain on the crankshaft sprocket, aligning the colored (marked) link with the timing mark on the sprocket.

20. Install the RH timing chain on the camshaft sprocket, aligning the colored (marked) link with the timing marks on the sprocket.

21. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner.

- Tighten to 25 Nm (18 lb-ft).

### Engines with ratcheting timing chain tensioners

22. Remove the paper clip from the RH timing chain tensioner.

### Engines with non-ratcheting timing chain tensioners

23. Remove the Hydraulic Chain Tensioner Retaining Clip from the RH timing chain tensioner.

### All engines

24. Make sure that the colored (marked) chain links are lined up with the dots on the crankshaft sprocket and the camshaft sprockets.

25. Rotate the camshaft until the lobe is in the up position.

26. Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

27. **NOTE:** Lubricate the camshaft roller followers using clean engine oil.

Install the camshaft roller followers.

1. Install the Valve Spring Compressor.
2. Compress the valve spring.
3. Install the camshaft roller followers in their original locations.

28. **NOTICE:** Only use hand tools when removing or installing the spark plugs, damage may occur to the cylinder head or spark plug.

Install the 8 spark plugs.

- Tighten to 18 Nm (159 lb-in).

29. Install the 8 ignition coils and bolts (4 shown).
- Tighten to 6 Nm (53 lb-in).

30. Connect the 8 ignition coil electrical connectors (4 shown).

31. Install the crankshaft sensor ring on the crankshaft.

32. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

33. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system.**  
**For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

---

**Valve Train Components - Exploded View****NOTE:** LH shown, RH similar.

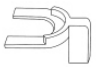

Item	Part Number	Description
1	6529	Camshaft roller follower (8 required)
2	6518	Valve spring retainer key (16 required)
3	6514	Valve spring retainer (8 required)
4	6513	Valve spring (8 required)
5	6A517	Valve stem seal (8 required)
6	N811085	Camshaft sprocket bolt
7	N806164	Camshaft sprocket bolt washer
8	6256	Camshaft sprocket
9	6265	Camshaft gear spacer
10	N807352	Camshaft bearing cap assembly bolt (13 required)
11	6B280	Camshaft bearing cap
12	6B280	Camshaft bearing cap
13	6A274	Camshaft
14	6C501	Hydraulic lash adjuster (8 required)

1. For additional information, refer to the procedures in this section.

## Valve Springs

### Special Tool(s)

 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1330-A	Compressor, Valve Spring 303-581 (T97T-6565-A)

### Removal

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the camshaft roller followers. For additional information, refer to [Camshaft Roller Follower](#) in this section.
3. Position the piston at the top of the stroke.
4. Remove the spark plugs. For additional information, refer to [Section 303-07](#) .
5. Install compressed air in the cylinder to hold both valves in position.
6. **NOTICE:** If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal or engine damage may occur.

Using the Valve Spring Compressor, compress the valve springs.

7. Remove the valve spring retainer keys, the valve spring retainer and the valve spring.

### Installation

1. Position the valve spring and the valve spring retainer.

2. Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

3. Using the Valve Spring Compressor, compress the valve spring. Install the valve spring retainer keys.

4. Remove the Valve Spring Compressor and Valve Spring Compressor Spacer.
5. Install the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.
6. Install the spark plugs. For additional information, refer to Section 303-07 .
7. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

## Valve Seals

### Special Tool(s)

 ST1330-A	Compressor, Valve Spring 303-581 (T97T-6565-A)
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91P-6571-A)

### Removal

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the valve springs. For additional information, refer to [Valve Springs](#) in this section.
3. Remove the valve stem seals.

### Installation

1. **NOTE:** The valve stem seal must be bottomed on the valve seat.

**NOTE:** Make sure that the garter spring is present in the valve stem seal.

Use the Valve Spring Compressor and Valve Stem Oil Seal Installer to install the valve stem seals.

2. Install the valve springs. For additional information, refer to [Valve Springs](#) in this section.
3. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

## Hydraulic Lash Adjuster

### Removal and Installation

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A .

2. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

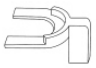

3. Remove the hydraulic lash adjusters.

4. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

---

**Camshaft Roller Follower****Special Tool(s)**

 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1330-A	Compressor, Valve Spring 303-581 (T97T-6565-A)

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A .

2. Remove the valve covers. For additional information, refer to Valve Cover - RH or Valve Cover - LH in this section.
3. Position the piston of the cylinder being repaired at the bottom of the stroke.
4. Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

5. Using the Valve Spring Compressor, compress the valve springs and remove the camshaft roller followers.

**Installation**

1. Using the Valve Spring Compressor, compress the valve spring and install the camshaft roller

followers.

2. Remove the Valve Spring Compressor from between the valve spring.

3. Install the valve covers. For additional information, refer to Valve Cover - RH or Valve Cover - LH in this section.
4. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

**Camshaft****Material**

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A .

2. **NOTICE:** At no time, when the timing chains are removed and the cylinder heads are installed, may the crankshaft or camshaft be rotated. Severe piston and valve damage will occur.

Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

3. Remove the timing chain. For additional information, refer to Timing Drive Components in this section.
4. Remove the bolt and the camshaft sprocket and spacer.
5. Remove the 13 camshaft bearing cap bolts.
6. Remove the camshaft bearing cap.
7. Remove the camshaft from the cylinder head.

**Installation**

1. Lubricate the camshaft journals with clean engine oil.

2. Install the camshaft onto the cylinder head.
3. Lubricate the camshaft bearing cap with clean engine oil.
4. Install the camshaft bearing caps and loosely install the bolts.
5. Tighten the bolts in the sequence shown.
  - Tighten to 10 Nm (89 lb-in).

6. Install the camshaft sprocket and bolt. Tighten the bolt in 2 stages.
  - Stage 1: Tighten to 40 Nm (30 lb-ft).
  - Stage 2: Tighten an additional 90 degrees (one-fourth turn).
7. Install the timing chains. For additional information, refer to [Timing Drive Components](#) in this section.
8. Install the roller followers. For additional information, refer to [Camshaft Roller Follower](#) in this section.
9. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.**

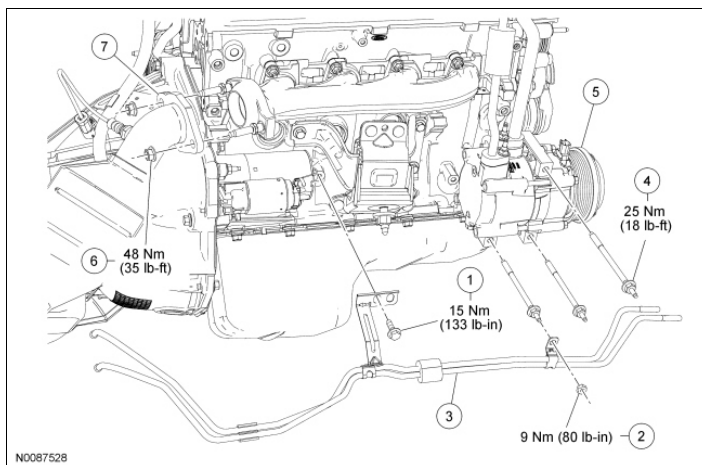

If equipped with a fire suppression system, repower the system.

3	14A464	A/C compressor electrical connector (part of 12B637)

**Exhaust Manifold - RH (View 2 of 3)**

Item	Part Number	Description
1	N807218	Transmission cooler tube bracket bolt
2	W705443	Transmission cooler tube bracket nut
3	7H420	Transmission cooler tube assembly
4	W707821	A/C compressor stud bolt (3 required)
5	19D629	A/C compressor

6	N811485	Catalytic converter-to-exhaust manifold nut (2 required)
7	5F250	Catalytic converter flange

**Exhaust Manifold - RH (View 3 of 3)**

Item	Part Number	Description
1	W701706	Exhaust manifold nut (8 required)
2	9430	Exhaust manifold
3	9Y431	Exhaust manifold gasket (2 required)
4	W707747	Exhaust manifold stud (8 required)

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#) .
3. Rotate the drive belt tensioner clockwise and remove the drive belt.

4. Disconnect the Crankshaft Position (CKP) sensor electrical connector.
5. Disconnect the A/C compressor electrical connector.
6. Remove the bolt from the transmission cooler tube bracket.

7. Remove the nut and position aside the transmission cooler tube assembly.
8. Remove the 3 bolts and position aside the A/C compressor.
9. Remove the catalytic converter-to-exhaust manifold nuts and position aside the catalytic converter flange.
  - Discard the nuts.
10. Remove the 8 nuts, the exhaust manifold and the gasket.
  - Discard the nuts and gasket.
11. Remove and discard the 8 exhaust manifold studs.
12. Clean and inspect the exhaust manifold for flatness. For additional information, refer to Section 303-00.

### Installation

1. Install the 8 new exhaust manifold studs.
  - Tighten to 12 Nm (106 lb-in).
2. Install a new exhaust manifold gasket, the exhaust manifold and 8 new nuts.
  - Tighten in sequence shown to 20 Nm (177 lb-in).

3. Position the catalytic converter flange and install the new catalytic converter-to-exhaust manifold nuts.
  - Tighten to 48 Nm (35 lb-ft).
4. Position the A/C compressor and install the 3 bolts.
  - Tighten to 25 Nm (18 lb-ft).
5. Position the transmission cooler tube assembly and install the nut.
  - To install, tighten to 9 Nm (80 lb-in).
6. Install the transmission cooler tube bracket bolt.
  - To install, tighten to 15 Nm (133 lb-in).
7. Connect the A/C compressor electrical connector.
8. Connect the CKP sensor electrical connector.
9. Rotate the drive belt tensioner clockwise and install the drive belt.

10. Connect the battery ground cable. For additional information, refer to Section 414-01 .
11. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

**Exhaust Manifold - LH****Exhaust Manifold - LH (View 1 of 2)**

Item	Part Number	Description
1	W710821	Intermediate steering shaft pinch bolt
2	3C662	Intermediate steering shaft
3	W707130	Exhaust manifold heat shield bolt (2 required)
4	9Y427	Exhaust manifold heat shield
5	N811485	Catalytic converter-to-exhaust manifold nut (2 required)
6	5F250	Catalytic converter flange
7	9D477	EGR system module tube

**Exhaust Manifold - LH (View 2 of 2)**

Item	Part Number	Description
1	W701706	Exhaust manifold nut (8 required)
2	9431	Exhaust manifold

3	9Y431	Exhaust manifold gasket (2 required)
4	W707747	Exhaust manifold stud (8 required)

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

Using a suitable holding device, hold the steering wheel in the straight-ahead position.

3. **NOTICE:** Do not allow the intermediate shaft to rotate while it is disconnected from the steering gear or damage to the clockspring may result. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to [Section 501-20B](#) .

Remove the intermediated shaft pinch bolt and detach the intermediate shaft from the steering gear and position aside.

4. Remove the 2 exhaust manifold heat shield bolts and the shield.
5. Remove the 2 catalytic converter-to-exhaust manifold nuts and position aside the catalytic converter flange.
  - Discard the nuts.
6. Disconnect the EGR system module tube from the exhaust manifold.
7. Remove the LH Heated Oxygen Sensor (HO2S). For additional information, refer to [Section 303-14](#) .
8. Remove the 8 nuts, the exhaust manifold and the gasket.
  - Discard the nuts and gasket.
9. Remove and discard the 8 exhaust manifold studs.
10. Clean and inspect the exhaust manifold for flatness. For additional information, refer to [Section 303-00](#) .

**Installation**

1. Install the 8 new exhaust manifold studs.
  - Tighten to 12 Nm (106 lb-in).

2. Install a new exhaust manifold gasket, the exhaust manifold and 8 new nuts.
  - Tighten in sequence shown to 20 Nm (177 lb-in).

3. Install the LH HO2S . For additional information, refer to [Section 303-14](#) .
4. Connect the EGR system module tube to the exhaust manifold.
  - Tighten to 43 Nm (32 lb-ft).
5. Position the catalytic converter flange and install the new catalytic converter-to-exhaust manifold nuts.
  - Tighten to 48 Nm (35 lb-ft).
6. Install the exhaust manifold heat shield and the 2 bolts.
  - Tighten to 10 Nm (89 lb-in).
7. Position the intermediate shaft on the steering gear and install the pinch bolt.
  - Tighten to 30 Nm (22 lb-ft).
8. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

---

**Engine Lubrication Components - Exploded View, Oil Pan, Oil Pump, Oil Pump Screen and Pickup Tube**

Item	Part Number	Description
1	6730	Oil pan drain plug
2	-	Pin-type wire harness retainer (part of 12B637) (2 required)
3	W701605	Oil pan bolt (16 required)
4	6675	Oil pan
5	6710	Oil pan gasket
6	N605904	Oil pump screen and pickup tube-to-spacer bolt
7	N806155	Oil pump screen and pickup tube-to-oil pump bolt (2 required)
8	6622	Oil pump screen and pickup tube
9	6625	Oil pump screen and tube O-ring seal
10	N806183	Oil pump bolt (3 required)
11	6621	Oil pump

1. For additional information, refer to the procedures in this section.

**Oil Pan**

## Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Silicone Gasket Remover ZC-30	-

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the front crossmember. For additional information, refer to [Section 502-02](#) .
3. Remove the bolt and the nut. Position the transmission cooler tubes aside.

4. Drain the engine oil.
  - Install the drain plug when finished.
  - Tighten to 23 Nm (17 lb-ft).
5. Detach the 2 pin-type wire harness retainers.
6. Remove the oil pan bolts in the sequence shown.

7. Remove the oil pan and the gasket.

### Installation

1. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the gasket mating surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

Clean and inspect the mating surfaces.

2. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply silicone gasket and sealant at the rear seal retainer-to-cylinder block sealing surface.

3. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply silicone gasket and sealant at the engine front cover-to-cylinder block mating surface.

4. Position the oil pan gasket and the oil pan.
5. Tighten the bolts in 2 stages, in the sequence shown.
  - Stage 1: Tighten to 20 Nm (177 lb-in).
  - Stage 2: Rotate an additional 60 degrees.

6. Attach the 2 pin-type wire harness retainers.
7. Position the transmission cooler tubes and install the bolt and the nut.
  1. Tighten the bolt to 15 Nm (133 lb-in).
  2. Tighten the nut to 9 Nm (80 lb-in).

8. Install the front crossmember. For additional information, refer to [Section 502-02](#).
9. Fill the engine with clean engine oil.
10. Start the engine and check for leaks.

11.  **WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

---

## Oil Pump

### Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

### Removal

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B** . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **Section 100-02A** .

2. Remove the oil pan. For additional information, refer to **Engine Lubrication Components - Exploded View, Oil Pan, Oil Pump, Oil Pump Screen and Pickup Tube** and **Oil Pan** in this section.
3. Remove the timing drive components. For additional information, refer to **Timing Drive Components** in this section.
4. Remove the 3 bolts, the oil pump screen and pickup tube.
  - Discard the O-ring seal.
5. Remove the 3 bolts and the oil pump.

### Installation

1. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging. Inspect the mating surfaces.

2. Position the oil pump and install the 3 bolts.
  - Tighten to 10 Nm (89 lb-in).
3. **NOTICE:** Make sure the O-ring seal is in place and not damaged. A missing or damaged O-ring seal can cause foam in the lubrication system, low oil pressure and severe engine damage.

**NOTE:** Clean and inspect the mating surfaces and install a new O-ring seal. Lubricate the O-ring seal with clean engine oil prior to installation.

Position the oil pump screen and pickup tube and install the bolts.

- Tighten the oil pump screen and pickup tube-to-oil pump bolts to 10 Nm (89 lb-in).
  - Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).
4. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.
  5. Install the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View, Oil Pan, Oil Pump, Oil Pump Screen and Pickup Tube and Oil Pan in this section.
  6. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

---

**Oil Pump Screen and Pickup Tube**

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A .

2. Remove the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View, Oil Pan, Oil Pump, Oil Pump Screen and Pickup Tube and Oil Pan in this section.
3. Remove the 3 bolts, the oil pump screen and pickup tube.
  - Discard the O-ring seal.

**Installation**

1. **NOTICE:** Make sure the O-ring seal is in place and not damaged. A missing or damaged O-ring seal can cause foam in the lubrication system, low oil pressure and severe engine damage.

**NOTE:** Clean and inspect the mating surfaces and install a new O-ring seal. Lubricate the O-ring seal with clean engine oil prior to installation.

Position the oil pump screen and pickup tube and install the bolts.

- Tighten the oil pump screen and pickup tube-to-oil pump bolts to 10 Nm (89 lb-in).
  - Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).
2. Install the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View, Oil Pan, Oil Pump, Oil Pump Screen and Pickup Tube and Oil Pan in this section.
  3. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

**Oil Filter Adapter**

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**Oil Filter Adapter Without Oil Cooler**

Item	Part Number	Description
1	W525939	Lower radiator hose clamp
2	8B273	Lower radiator hose
3	6714	Oil filter
4	14A464	Engine Oil Pressure (EOP) switch electrical connector (part of 12B637)
5	W705128	Oil filter adapter bolt (4 required)
6	6881	Oil filter adapter
7	6A636	Oil filter adapter gasket

**Oil Filter Adapter With Oil Cooler**

Item	Part Number	Description
1	W525939	Lower radiator hose clamp
2	8B273	Lower radiator hose
3	6714	Oil filter
4	14A464	Engine Oil Pressure (EOP) switch electrical connector (part of 12B637)
5	6890	Oil cooler mounting bolt
6	6A642	Oil cooler
7	W705128	Oil filter adapter bolt (4 required)
8	6881	Oil filter adapter
9	6A636	Oil filter adapter gasket

### Removal

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Drain the cooling system. For additional information, refer to [Section 303-03](#) .
3. Disconnect the lower radiator hose from the oil filter adapter.
4. Remove and discard the oil filter.
5. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.
6. If equipped, remove the oil cooler mounting bolt and position the oil cooler aside.
7. Remove the 4 bolts and the oil filter adapter and gasket.
  - Discard the oil filter adapter gasket.

### Installation

1. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surface. These tools cause scratches and gouges that make leak paths.

**Use a plastic scraping tool to remove all traces of the gasket material.**

Clean the sealing surfaces.

2. Install a new gasket and the oil filter adapter and tighten the 4 bolts in the sequence shown.
  - Tighten to 25 Nm (18 lb-ft).

3. **NOTE:** Lubricate the oil cooler-to-oil filter adapter seal with clean engine oil.

If equipped, position the oil cooler and install the oil cooler mounting bolt.

- Tighten to 46 Nm (34 lb-ft).

4. Connect the EOP switch electrical connector.

5. **NOTE:** Lubricate the oil filter seal with clean engine oil.

Install the oil filter.

6. Connect the lower radiator hose to the oil filter adapter.

7. Fill and bleed the cooling system. For additional information, refer to Section 303-03 .

8. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

**Oil Cooler**

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number	Description
1	6714	Oil filter
2	8B273	Oil cooler coolant hose (2 required)
3	6890	Oil cooler mounting bolt
4	6A642	Oil cooler
5	-	Oil cooler-to-oil filter adapter O-ring seal
6	15161	Coolant hose clamp
7	8286	Coolant hose
8	15161	Coolant hose clamp
9	8286	Coolant hose
10	-	Coolant tube
11	-	Cooler tube mounting bracket

**Removal and Installation**

1. **⚠ WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.**

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A .

2. Drain the cooling system. For additional information, refer to Section 303-03 .
3. Remove and discard the oil filter.
  - To install, lubricate the new oil filter O-ring seal with clean engine oil.

4. **NOTICE: For correct installation, the white lines on the coolant hoses must be aligned with the black dots on the oil cooler tubes. If the black dots are not visible, mark the oil cooler tube with a permanent marker before disconnecting the hoses. Failure to follow this instruction may result in damage to the coolant hoses.**

Disconnect the 2 coolant hoses from the oil cooler.

- To install, align the white lines on the coolant hoses with the black dots on the cooler tubes.

5. **NOTICE: If metal or aluminum material is present in the oil cooler, mechanical concerns exist. Severe damage to the engine may occur. To diagnose mechanical concerns, refer to Section 303-00 . Failure to follow this instruction may result in additional engine damage.**

Remove the oil cooler mounting bolt and the oil cooler and inspect.

- To install, lubricate the oil cooler-to-oil filter adapter O-ring seal with clean engine oil.
- To install, tighten to 46 Nm (34 lb-ft).

6. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

**Engine Oil Pressure (EOP) Switch**

Item	Part Number	Description
1	14A464	Engine Oil Pressure (EOP) switch electrical connector (part of 12B637)
2	9278	EOP switch

**Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Disconnect the Engine Oil Pressure (EOP) switch electrical connector and remove the EOP switch.
  - To install, tighten to 14 Nm (124 lb-in), then tighten an additional 180 degrees.
3. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

**Oil Level Indicator and Tube**

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number	Description
1	N806155	Oil level indicator tube bolt
2	6754	Oil level indicator tube
3	-	Oil level indicator tube O-ring seal

**Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the LH exhaust manifold. For additional information, refer to [Exhaust Manifold - LH](#) in this section.
3. Remove the oil level indicator.
4. Remove the bolt and the oil level indicator tube.
  - To install, tighten to 10 Nm (89 lb-in).

5. **NOTICE:** Failure to lubricate the O-ring seal and the oil level indicator tube-to-engine block

mating surface with clean engine oil may result in engine oil leaks.

**NOTICE:** Make sure the O-ring seal remains in position and does not roll up the indicator tube during installation or engine oil leaks may occur.

Remove the O-ring seal and discard.

6.  **WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

- Lubricate the new O-ring seal and engine mating surface with clean engine oil.
-

**Lower End Components - Exploded View, Flexplate and Crankshaft Rear Seal with Retainer Plate**

Item	Part Number	Description
1	N806168	Flexplate bolt (6 required)
2	6375	Flexplate
3	6A373	Engine-to-transmission spacer plate
4	6310	Crankshaft oil slinger
5	6701	Crankshaft rear seal
6	W707492	Engine mount nut (2 required)
7	6730	Oil pan drain plug
8	-	Wire harness pin-type retainer (2 required)
9	W701605	Oil pan bolt (16 required)
10	6675	Oil pan
11	6710	Oil pan gasket
12	N605904	Oil pump screen and pickup tube bolt
13	N806155	Oil pump screen and pickup tube bolt (2 required)
14	6622	Oil pump screen and pickup tube
15	N806155	Crankshaft rear seal retainer plate bolt (6 required)
16	6K318	Crankshaft rear seal retainer plate

1. For additional information, refer to the procedures in this section.

---

## Flexplate

### Removal

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02A .

2. Remove the transmission. For additional information, refer to Section 307-01 .
3. Remove the 6 bolts and the flexplate.

### Installation

1. Position the flexplate and loosely install the 6 bolts. Tighten the bolts in the sequence shown to 80 Nm (59 lb-ft).

2. Install the transmission. For additional information, refer to Section 307-01 .
3. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

---

**Crankshaft Rear Seal**

## Special Tool(s)

 ST1479-A	Installer, Crankshaft Rear Oil Seal 303-516 (T95P-6701-BH)
 ST1480-A	Installer, Crankshaft Rear Oil Seal 303-518 (T95P-6701-DH)
 ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B**. Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **Section 100-02A**.

2. Remove the flexplate. For additional information, refer to **Flexplate** in this section.
3. Using the Crankshaft Rear Oil Slinger Remover and Slide Hammer, remove the crankshaft oil slinger.

4. Using the Crankshaft Rear Oil Seal Remover and Slide Hammer, remove the crankshaft rear seal.

## Installation

1. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with engine oil.

Using the Crankshaft Rear Oil Seal Installers, install the crankshaft rear seal.

2. Using the Crankshaft Rear Oil Slinger Installer and Crankshaft Rear Oil Seal Installers, install the crankshaft oil slinger.

3. Install the flexplate. For additional information, refer to [Flexplate](#) in this section.
4. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

## Material

Item	Specification
Gasket Maker TA-16	WSK-M2G348-A5
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or	WSS-M2C930-A

equivalent	
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Silicone Gasket Remover ZC-30	-

**Removal**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the flexplate. For additional information, refer to [Flexplate](#) in this section.
3. Remove the engine-to-transmission spacer plate.

4. Using the Crankshaft Rear Oil Slinger Remover and Slide Hammer, remove the crankshaft oil slinger.

5. Using the Crankshaft Rear Oil Seal Remover and Slide Hammer, remove the crankshaft rear seal.

6. **NOTE:** LH shown, RH similar.

Remove the 2 engine mount nuts.

7. Install the Engine Lifting Bracket to the RH cylinder head.

8. Install the Engine Lifting Bracket to the LH cylinder head.

9. Install the Engine Support Bar.

10. Using the Engine Support Bar, raise the engine.

11. Drain the engine oil.

- Install the drain plug when finished.
- Tighten to 23 Nm (17 lb-ft).

12. Detach the 2 pin-type wire harness retainers.

13. Remove the oil pan bolts in the sequence shown and partially lower the oil pan.

14. Remove the 3 bolts and position the oil pump screen and pickup tube into the oil pan and remove the oil pan.
  - Discard the pickup tube O-ring seal.
  - Discard the oil pan gasket.
15. Remove the 6 bolts and the crankcase rear seal retainer plate.

### Installation

1. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

**NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Clean and inspect the mating surface.

2. **NOTE:** The rear crankshaft seal retainer plate does not have a sealant groove. Gasket maker must be applied to the rear crankshaft seal retainer mating surface on the engine block.

Apply a bead of gasket maker to the rear crankshaft seal retainer mating surface on the engine block.

3. Install the rear oil seal retainer plate and loosely install the 6 crankcase rear seal retainer plate bolts.
4. Tighten the rear seal retainer plate bolts in the sequence shown.
  - Tighten to 10 Nm (89 lb-in).

5. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with engine oil.

Using the Crankshaft Rear Oil Seal Installers, install the crankshaft rear seal.

6. Using the Crankshaft Rear Oil Slinger Installer and Crankshaft Rear Oil Seal Installers, install the crankshaft oil slinger.

7. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

Inspect the oil pan. Clean the mating surface for the oil pan with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

8. Position the oil pump screen and pickup tube in the oil pan and position the oil pan and new gasket into the vehicle.

9. **NOTICE:** Make sure to install a new O-ring seal. A missing or damaged O-ring seal may cause foam in the lubrication system, low oil pressure and severe engine damage.

**NOTE:** Clean and inspect the mating surfaces and install a new O-ring seal. Lubricate the O-ring seal with clean engine oil prior to installation.

Position the oil pump screen and pickup tube and install the bolts.

- Tighten the oil pump screen and pickup tube-to-oil pump bolts to 10 Nm (89 lb-in).
- Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).

10. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply silicone gasket and sealant at the rear seal retainer-to-cylinder block sealing surface.

11. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply silicone gasket and sealant at the engine front cover-to-cylinder block mating surface.

12. Install the oil pan bolts, tighten in the sequence shown, in 2 stages.

- Stage 1: Tighten to 20 Nm (177 lb-in).
- Stage 2: Rotate an additional 60 degrees.

13. Attach the 2 pin-type wire harness retainers.
14. Align the engine mount studs and lower the engine.
15. **NOTE:** LH shown, RH similar.

Install the 2 engine mount nuts.

- Tighten to 90 Nm (66 lb-ft).

16. Install the engine-to-transmission spacer plate.

17. Install the flexplate. For additional information, refer to Flexplate in this section.

18. Fill the engine with clean engine oil.

19. Start the engine and check for leaks.

20. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

**Engine Mount - RH**

## Special Tool(s)

 ST1595-A	Lifting Bracket, Engine 303-050 (T70P-6000)
 ST2425-A	Support Bar, Engine 303-F072

Item	Part Number	Description
1	W707492	RH engine mount nut
2	W710646	RH engine mount bolt (3 required)
3	6038	RH engine mount

**Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the generator. For additional information, refer to [Section 414-00](#) .
3. Install the Engine Lifting Bracket.

4. Install the Engine Support Bar.

5. Remove the RH and LH lower engine mount nuts.

- To install, tighten to 90 Nm (66 lb-ft).

6. Using the Engine Support Bar, raise the engine.

7. Remove the 3 RH engine mount bolts.

- To install, tighten to 70 Nm (52 lb-ft).

8. Remove the RH engine mount.

9. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

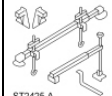

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

**Engine Mount - LH**

## Special Tool(s)

	Lifting Bracket, Engine 303-050 (T70P-6000)
	Support Bar, Engine 303-F072

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number	Description
1	6714	Oil filter
2	W707492	LH engine mount nut
3	W710646-S439	LH engine mount bolt (3 required)
4	6B032	LH engine mount

**Removal and Installation**

- ⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Remove the generator. For additional information, refer to [Section 414-00](#).
3. Install the Engine Lifting Bracket.

4. Install the Engine Support Bar.

5. Remove the oil filter and discard.
  - Lubricate the new oil filter O-ring seal with clean engine oil prior to installation.
6. Remove the LH and RH lower engine mount nuts.
  - To install, tighten to 90 Nm (66 lb-ft).
7. Using the Engine Support Bar, raise the engine.

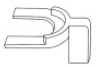

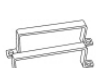

8. Remove the 3 bolts and the LH engine mount.
  - To install, tighten to 70 Nm (52 lb-ft).
9. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#). Failure to follow these instructions may result in serious personal injury.**

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

**Cylinder Head**

## Special Tool(s)

 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket Remover ZC-30	-

**Removal****Cylinder heads**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B**. Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **Section 100-02A**.

2. Remove the engine. For additional information, refer to **Engine** in the Removal portion of this section.
3. Remove the bolts and the flexplate.

4. Remove the engine/transmission spacer plate.

5. Using the Engine Lifting Bracket Set, mount the engine on a suitable engine stand.

6. If equipped with cylinder block drain plugs, remove the bolts and the RH engine mount.

7. **NOTE:** LH shown, RH similar.

If equipped, remove the drain plugs from the engine block. Allow the coolant to completely drain.

- Install the drain plugs when finished.
- To install, tighten to 20 Nm (177 lb-in).

8. Remove the bolt and the battery cables from the engine.

9. Disconnect the EGR tube from the exhaust manifold.

10. Disconnect the 8 ignition coil electrical connectors (4 shown).

11. Disconnect the 8 fuel injector electrical connectors (4 shown).

12. Remove the 2 bolts and the intake manifold shield.

13. Remove the crankcase ventilation tube.

14. Disconnect the generator electrical connector and detach the wire harness retainer.

15. Remove the generator mounting bracket.

- Remove the 4 bolts.
- Remove the bracket.

16. Disconnect the throttle control and the Throttle Position (TP) sensor electrical connectors.

17. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

18. Disconnect the Camshaft Position (CMP) sensor electrical connector.

19. Disconnect the radio ignition interference capacitor and remove the engine control sensor wiring.

20. Disconnect the fuel charging wiring from the crash bracket and the wiring support bracket and remove the harness from the engine.

21. Disconnect the EGR tube nut from the EGR system module.

22. Remove the generator.  
1. Remove the 2 bolts.  
2. Remove the generator.

23. Remove the intake manifold crash bracket bolt and prevent the bolt from contacting the cylinder head with a rubber band or tie strap.

24. Remove the intake manifold crash bracket stud bolt.

25. Remove the 8 bolts and the 8 ignition coils (4 shown).

26. Remove the 2 bolts and the coolant outlet adapter.

27. Remove the thermostat.

28. Remove the 8 bolts and the intake manifold.  
• Discard the intake manifold gaskets.

29. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

Clean the sealing surfaces.

30. Remove the coolant bypass tube.
  1. Remove the retaining nut.
  2. Remove the ground strap.
  3. Remove the coolant bypass tube.

31. Loosen the studs and bolts and remove the LH valve cover.
  - Clean the mating surface and discard gasket.

32. Loosen the studs and bolts and remove the RH valve cover.
  - Discard the gasket.

33. **NOTICE:** Only use hand tools when removing or installing the spark plugs, damage may occur to the cylinder head or spark plug.

**NOTE:** Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

Remove the spark plugs.

34. Position the lobe of the camshaft upward.

35. Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

36. **NOTICE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.

Using the Valve Spring Compressor, compress the valve springs and remove the camshaft roller followers.

37. **NOTICE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.

Remove the 16 hydraulic lash adjusters (4 shown).

38. Remove the bolt and the belt idler pulley.

39. Remove the coolant pump pulley.

40. Remove the crankshaft pulley bolt.

41. Using the Crankshaft Vibration Damper Remover, remove the crankshaft pulley.

42. Using the Crankshaft Front Oil Seal Remover, remove the crankshaft front oil seal.

43. Remove the front 4 oil pan bolts.

44. **NOTE:** Correct fastener location is essential for the installation. Record fastener location.

Remove the 15 fasteners in the sequence shown.

45. Remove the engine front cover from the cylinder block.

- Discard the gaskets.

46. Remove the crankshaft sensor ring.

47. Position the crankshaft with the keyway at the 12 o'clock position.

48. **NOTE:** LH shown, RH similar.

Remove the timing chain tensioning system from both timing chains.

1. Remove the bolts.
2. Remove the timing chain tensioners.
3. Remove the timing chain tensioner arms.

49. Remove the LH and RH timing chains and the crankshaft sprocket.

- Remove the RH timing chain from the camshaft sprocket.
- Remove the RH timing chain from the crankshaft sprocket.
- Repeat for the LH timing chain and crankshaft sprocket.

50. Remove both timing chain guides.

1. Remove the bolts.
2. Remove the LH timing chain guide.
3. Remove the bolts.
4. Remove the RH timing chain guide.

### RH cylinder head

51. Remove the RH exhaust manifold.
  1. Remove the nuts and discard.
  2. Remove the RH exhaust manifold.
  3. Remove and discard the RH exhaust manifold gasket.

52. Remove and discard the 8 RH exhaust manifold studs.

### LH cylinder head

53. Remove the LH exhaust manifold.
  1. Remove the nuts and discard.
  2. Remove the LH exhaust manifold.
  3. Remove and discard the LH exhaust manifold gaskets.

54. Remove and discard the 8 LH exhaust manifold studs.

55. Remove the bolt and the oil level indicator tube.

56. Remove the cylinder head insert from the LH cylinder head.

### Both cylinder heads

57. Clean and inspect the exhaust manifolds. For additional information, refer to [Section 303-00](#) .

58. Install the Cylinder Head Remover/Installer on both ends of the cylinder head.

### RH cylinder head

59. **NOTICE:** The cylinder head must be cool before removing it from the engine. Cylinder head warpage may result if a warm or hot cylinder head is removed.

**NOTICE:** Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface. The scratches may cause leak paths.

**NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

**NOTE:** Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.

**NOTE:** The cylinder head bolts must be discarded and new bolts installed. They are a tighten-to-yield design and cannot be reused.

Remove the bolts and the RH cylinder head.

- Discard the cylinder head gasket.
- Discard the cylinder head bolts.

### LH cylinder head

60. **NOTICE:** The cylinder head must be cool before removing it from the engine. Cylinder head warpage may result if a warm or hot cylinder head is removed.

**NOTICE:** Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface. The scratches may cause leak paths.

**NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

**NOTE:** Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.

**NOTE:** The cylinder head bolts must be discarded and new bolts installed. They are a tighten-to-yield design and cannot be reused.

Remove the bolts and the LH cylinder head.

- Discard the cylinder head gasket.
- Discard the cylinder head bolts.

### Both cylinder heads

61. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

**NOTE:** Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

**NOTE:** If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block in the following sequence.

1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

62. **NOTE:** LH shown, RH similar.

Support the cylinder heads on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion, paying particular attention to the oil pressure feed area. For additional information, refer to Section 303-00.

**Engine**

## Special Tool(s)

 ST2443-A	<b>Lifting Bracket Set, Engine</b> <b>303-DS086 (D93P-6001-A)</b>  Includes Lifting Bracket, Engine 303-D087 and 303-D088 or equivalent
 ST1448-A	<b>Socket, Exhaust Gas Oxygen Sensor</b> <b>303-476 (T94P-9472-A)</b>

## Material

Item	Specification
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information refer to [Section 100-02A](#) .

2. Release the fuel pressure. For additional information, refer to [Section 310-00](#) .
3. Remove the hood.
4. Disconnect both battery cables. For additional information, refer to [Section 414-01](#) .
5. Remove the Air Cleaner (ACL) and outlet pipe. For additional information, refer to [Section 303-12](#) .
6. Remove the wiper mounting arm and pivot shaft. For additional information, refer to [Section 501-16](#) .
7. Remove the 2 nuts and the support bracket.

8. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#) .

9. Drain the engine cooling system. For additional information, refer to [Section 303-03](#).

10. Disconnect the vacuum hose.

11. Disconnect the Evaporative Emission (EVAP) canister purge valve.

- Disconnect the 2 quick release EVAP hoses.
- Disconnect the electrical connector.

12. Disconnect the fuel tube spring lock coupling. For additional information, refer to [Section 310-00](#).

13. Detach the generator battery cable retainer from the RH valve cover stud bolt.

14. Remove the nut and disconnect the generator battery cable.

- Detach the generator battery cable pin-type retainer.

15. Disconnect the PCM electrical connectors.

16. Remove the bolt and ground wire.

17. Disconnect the A/C electrical connector.

18. Disconnect the A/C low charge protection switch electrical connector.

19. Disconnect the heater hoses.

20. Remove the bolt and the ground strap.

21. Disconnect the upper radiator hose from the hose connection. Secure the hose to the radiator assembly.

22. Disconnect the lower radiator hose from the oil filter adapter.

23. Remove the cooling fan. For additional information, refer to [Section 303-03](#) .

24. Drain the engine oil.

- Install the drain plug when finished.
- To install, tighten to 23 Nm (17 lb-ft).

25. Remove and discard the oil filter.

26. If equipped, disconnect the block heater electrical connector.

27. Disconnect the power steering electrical connector.

28. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

29. Disconnect the Power Steering Pressure (PSP) switch electrical connector.

30. **NOTICE:** For correct installation, the white lines on the coolant hoses must be aligned with the black dots on the oil cooler tubes. If the black dots are not visible, mark the oil cooler tube with a permanent marker before disconnecting the hoses. Failure to follow this instruction may result in damage to the coolant hoses.

If equipped, disconnect the 2 coolant hoses from the oil cooler.

31. Remove the nut and the transmission cooler tube support bracket.

32. Remove the transmission oil cooler tube bracket bolt.

33. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

34. Position the power steering tube bracket aside.

35. Disconnect the engine wiring harness retainers from the A/C compressor.

36. Disconnect the A/C compressor electrical connector.

37. Remove the 3 bolts and position the A/C compressor aside.

38. Remove the 3 bolts and position the power steering pump aside.

39. Remove the starter motor. For additional information, refer to [Section 303-06](#) .

40. Disconnect the RH Heated Oxygen Sensor (HO2S) electrical connectors.

41. Disconnect the LH HO2S electrical connector.

42. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

Using the Exhaust Gas Oxygen Sensor Socket, remove the LH HO2S .

43. Support the exhaust and remove the 4 nuts.  
• Discard the 4 nuts.

44. **NOTE:** LH shown, RH similar.

Remove the 2 engine mount nuts.

45. Install a suitable lifting device under the transmission and support.

46. Remove the rear transmission insulator nuts.

47. Raise the transmission and remove the rear transmission insulator bolts.

48. Remove the transmission rear insulator and lower the transmission down to rest on the rear crossmember.

49. Disconnect the HO2S sensor and the solenoid body sensor electrical connectors.

50. Disconnect the Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor and the Turbine Shaft Speed (TSS) sensor electrical connectors.

51. Release the wiring harness from the retainers on the transmission.

52. Remove the 3 bolts and the inspection cover.

53. Remove the torque converter nut access plug.  
• Remove the 4 nuts.

54. Remove the 4 bolts and 1 stud (2 bolts shown).

55. Install the Engine Lifting Bracket to the RH cylinder head.

56. Install the Engine Lifting Bracket to the LH cylinder head.

57. Install the Engine Lifting Bracket Set.

58. Remove the 2 bellhousing bolts.

59. Remove the engine assembly from the vehicle.

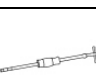

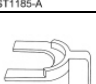

SECTION 303-01: Engine - 4.6L (2V)  
DISASSEMBLY

----------------------------------	---

## Disassembly

**NOTICE:** Servicing the bottom end of the engine (crankshaft, bearings) requires that cylinder heads be removed. Failure to do so may result in engine damage.

**NOTICE:** During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan may cause engine failure.

**NOTE:** The crankshaft rear seal, the rear oil seal slinger and the crankshaft rear seal retainer plate must be removed before mounting the engine on the engine stand.

**NOTE:** For additional information, refer to the exploded views under engine Assembly in this section.

1. Remove the 6 bolts and the flexplate.

2. Remove the engine/transmission spacer plate.

3. Using the Crankshaft Rear Oil Slinger Remover and Slide Hammer, remove the crankshaft rear seal slinger.

4. Using the Crankshaft Rear Oil Seal Remover and Slide Hammer, remove the crankshaft rear seal.

5. Remove the 2 oil pan-to-crankcase rear seal retainer plate bolts and the 6 crankcase rear seal retainer plate bolts.

6. Using the Engine Lifting Bracket Set, mount the engine on a suitable engine stand.

7. **NOTE:** RH shown, LH similar.

Remove the bolts and the LH and RH engine mounts.

8. **NOTE:** LH shown, RH similar.

If equipped, remove the drain plugs from the engine block. Allow the coolant to completely drain.

- Install the drain plugs when finished.
- To install, tighten to 20 Nm (177 lb-in).

9. Remove the bolt and the battery cables from the engine.

10. Disconnect the EGR tube from the exhaust manifold.

11. Disconnect the 8 ignition coil electrical connectors (4 shown).

12. Disconnect the 8 fuel injector electrical connectors (4 shown).

13. Remove the 2 bolts and the intake manifold shield.

14. Disconnect and remove the crankcase ventilation tube.

15. Disconnect the generator electrical connector and detach the wiring harness retainer.

16. Remove the 4 generator mounting bracket bolts and the bracket.

17. Disconnect the throttle control and the Throttle Position (TP) sensor electrical connectors.

18. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

19. Disconnect the Camshaft Position (CMP) sensor electrical connector.

20. Disconnect the radio ignition interference capacitor and remove the engine control sensor wiring.

21. Disconnect the Knock Sensor (KS) electrical connector and the wiring harness pin-type retainer.

22. Disconnect the vacuum hoses and the electrical connector.

23. Disconnect the fuel charging wiring from the intake manifold crash bracket and remove the harness from the engine assembly.

24. Disconnect the EGR tube nut from the EGR valve.

25. Remove the 2 generator bolts and the generator.

26. Remove the intake manifold crash bracket bolt and prevent the bolt from contacting the cylinder head with a rubber band or tie strap.

27. Remove the intake manifold crash bracket stud bolt.

28. Remove the 8 bolts and the 8 ignition coils (4 shown).

29. Remove the 2 bolts and the coolant outlet adapter.

30. Remove the thermostat.

31. Remove the 8 bolts and the intake manifold.  
• Discard the intake manifold gaskets.

32. Remove the cylinder head insert from the LH cylinder head.

33. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

Clean the sealing surfaces.

34. Remove the coolant bypass tube.

1. Remove the retaining nut.
2. Remove the ground strap.
3. Remove the coolant bypass tube.

35. Remove the nut and the KS .

36. Loosen the 6 studs and 5 bolts and remove the LH valve cover.
- Discard the gasket.

37. Loosen the 7 studs and 4 bolts and remove the RH valve cover.
- Discard the gasket.

38. **NOTICE:** Only use hand tools when removing or installing the spark plugs, damage may occur to the cylinder head or spark plug.

**NOTE:** Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

Remove the 8 spark plugs.

39. Position the lobe of the camshaft upward.

40. Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

41. **NOTICE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.

Using the Valve Spring Compressor, compress the valve springs and remove the 16 camshaft roller followers.

42. **NOTICE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.

Remove the 16 hydraulic lash adjusters (4 shown).

43. Remove the bolt and the accessory drive belt idler pulley.

44. Remove the 4 bolts and the coolant pump pulley.

45. Remove the 4 bolts and the coolant pump.

46. Remove the crankshaft pulley bolt.

47. Using the Crankshaft Vibration Damper Remover, remove the crankshaft pulley.

48. Using the Crankshaft Front Oil Seal Remover, remove the crankshaft front seal.

49. Remove the 16 bolts and the oil pan.  
• Discard the gasket.

50. Remove the 3 bolts, the oil pump screen and pickup tube.

51. Remove the oil pump screen and pickup tube spacer.

52. **NOTE:** Correct fastener location is essential for the assembly procedure. Record fastener location.

Remove the 15 fasteners in the sequence shown.

53. Remove the engine front cover from the cylinder block.

54. Remove the crankshaft sensor ring from the crankshaft.

55. Position the crankshaft with the keyway at the 12 o'clock position.

56. Remove the timing chain tensioning system from both timing chains.

1. Remove the 4 bolts.
2. Remove the timing chain tensioners.
3. Remove the timing chain tensioner arms.

57. **NOTICE:** Unless otherwise instructed, at no time when the timing chains are removed and the cylinder heads are installed is the crankshaft or camshaft to be rotated. Severe piston and valve damage will occur.

Remove the LH and RH timing chains and the crankshaft sprocket.

- Remove the RH timing chain from the camshaft sprocket.
- Remove the RH timing chain from the crankshaft sprocket.
- Repeat for the LH timing chain and crankshaft sprocket.

58. Remove both timing chain guides.

1. Remove the 4 bolts.
2. Remove the LH timing chain guide.
3. Remove the bolts.
4. Remove the RH timing chain guide.

59. Remove the RH exhaust manifold.

1. Remove the 8 nuts and discard.
2. Remove the RH exhaust manifold.
3. Remove the RH exhaust manifold gasket and discard.

60. Remove and discard the 8 RH exhaust manifold studs.

61. Remove the LH exhaust manifold.

1. Remove the 8 nuts and discard.
2. Remove the LH exhaust manifold.
3. Remove the LH exhaust manifold gaskets and discard.

62. Remove and discard the 8 LH exhaust manifold studs.

63. Clean and inspect the exhaust manifolds. For additional information, refer to [Section 303-00](#).

64. Remove the bolt and the oil level indicator tube.

65. Install the Cylinder Head Remover/Installer on both ends of the cylinder head.

66. **NOTICE:** The cylinder head must be cool before removing it from the engine. Cylinder head warpage may result if a warm or hot cylinder head is removed.

**NOTICE:** Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface. The scratches may cause leak paths.

**NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

**NOTE:** Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.

**NOTE:** The cylinder head bolts must be discarded and new bolts installed. They are a tighten-to-yield design and cannot be reused.

Remove the 10 bolts and the RH cylinder head.

- Discard the cylinder head gasket.
- Discard the cylinder head bolts.

67. **NOTICE:** The cylinder head must be cool before removing it from the engine. Cylinder head warpage may result if a warm or hot cylinder head is removed.

**NOTICE:** Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface. The scratches may cause leak paths.

**NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

**NOTE:** Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.

**NOTE:** The cylinder head bolts must be discarded and new bolts installed. They are a tighten-to-yield design and cannot be reused.

Remove the 10 bolts and the LH cylinder head.

- Discard the cylinder head gasket.
- Discard the cylinder head bolts.

68. **NOTICE:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

**NOTE:** Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

**NOTE:** If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

Clean the cylinder head-to-cylinder block mating surfaces of both cylinder heads and the cylinder block in the following sequence.

1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

69. **NOTE:** LH shown, RH similar.

Support the cylinder heads on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion paying particular attention to the oil pressure feed area. For additional information, refer to Section 303-00 .

70. **NOTICE:** The oil cooler must be replaced or severe damage to the engine can occur.

If equipped, remove the oil cooler mounting bolt and remove and discard the oil cooler.

71. Remove the 4 bolts and the oil filter adapter.

- Discard the gasket.

72. Remove the 3 oil pump bolts and the oil pump.

73. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using a Cylinder Ridge Reamer, following the manufacturer instructions.

74. **NOTE:** Verify that the connecting rods and rod caps have orientation numbers cast into them. If not, number the connecting rods and rod caps for correct orientation.

Remove the 2 bolts and the connecting rod cap.

- Discard the bolts.

75. **NOTE:** Do not scratch the cylinder walls or crankshaft journals with the connecting rod.

Using the Connecting Rod Installer, push the piston through the top of the cylinder block.

76. **NOTICE:** Servicing the bottom end of the engine (crankshaft, bearings) requires that cylinder heads be removed. Failure to do so may result in engine damage.

Remove the crankshaft bearing cap fasteners.

1. Remove and discard the 10 cross-mounted main cap bolts.

2. Loosen the 10 jack screws.
3. Remove and discard the 10 main cap bolts.

77. Remove the 5 main bearing caps and the lower crankshaft main bearings.

78. Remove the crankshaft and the upper crankshaft main bearings from the cylinder block.

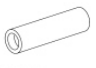

## SECTION 303-01: Engine - 4.6L (2V)

2010 Crown Victoria, Grand Marquis  
Workshop ManualDISASSEMBLY AND ASSEMBLY OF  
SUBASSEMBLIES

Procedure revision date: 08/19/2009

**Cylinder Head**

## Special Tool(s)

 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91P-6571-A)

## Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**NOTE:** LH shown, RH similar.

Item	Part Number	Description
1	6518	Valve spring retainer key (16 required)
2	6514	Valve spring retainer (8 required)
3	6513	Valve spring (8 required)
4	6A517	Valve stem seal (8 required)
5	6505	Intake valve (4 required)
6	6507	Exhaust valve (4 required)
7	N811085	Camshaft sprocket bolt
8	N806164	Camshaft sprocket bolt washer
9	6256	Camshaft sprocket
10	6265	Camshaft sprocket spacer
11	N807352	Camshaft bearing cap bolt (13 required)
12	6B280	Camshaft bearing cap
13	6B280	Camshaft bearing cap
14	6A274	Camshaft

### Disassembly

1. **NOTICE:** Place cylinder head on a cardboard or wood surface to prevent damage to the joint face.

**NOTE:** Do not remove the camshaft before removing the roller followers.

Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

2. Using the Valve Spring Compressor, compress the valve springs.

3. **NOTE:** Keep valves and valve spring retainer keys in order so they can be installed in their original positions.

Remove the valve spring retainer keys, the valve spring retainers, the valve springs and the valves.

4. Remove the valve stem seals.

5. **NOTE:** The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations.

Remove the bolts, the bearing caps and the camshaft.

## Assembly

1. **NOTE:** Do not use metal scrapers or other tools to clean the cylinder head.

Use a plastic scraper and metal surface prep to clean the cylinder head.

2. Lubricate the camshaft journals with clean engine oil.

3. Install the camshaft and the camshaft bearing caps.
  - Lubricate with clean engine oil and position the camshaft bearing caps.
  - Install the bolts loosely.

4. Tighten the camshaft bearing caps bolts in the sequence shown.
  - Tighten to 10 Nm (89 lb-in).

5. **NOTE:** Lubricate the valve stems with clean engine oil.

Install the valves in the cylinder head.

6. **NOTE:** Lubricate the valve stems seals with clean engine oil.

Using the Valve Stem Oil Seal Installer and Valve Spring Compressor, install the valve stem seals.

7. Install the valve springs and the valve spring retainers onto the valves.

8. Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

9. Using the Valve Spring Compressor, compress the valve springs and install the valve spring retainer keys.

10. Remove the Valve Spring Compressor Spacer.

**Piston**

## Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

N0004114

Item	Part Number	Description
1	6150	Piston compression upper ring
2	6152	Piston compression lower ring
3	6159	Piston oil control upper segment ring
4	6161	Piston oil control spacer
5	6159	Piston oil control lower segment ring
6	6140	Piston pin retainer
7	6140	Piston pin retainer
8	6135	Piston pin
9	6200	Connecting rod
10	6110	Piston

**Disassembly**

1. Remove the upper piston compression ring.
2. Remove the lower piston compression ring.
3. Remove the upper piston oil control segment ring.

4. Remove the piston oil control spacer.
5. Remove the lower piston oil control segment ring.
6. Remove the 2 piston pin retainers.
7. Remove the piston pin and remove the connecting rod from the piston.

### Assembly

1. **NOTE:** Connecting rod must be installed into piston with identification markings toward front.

Position the connecting rod in the piston.

2. **NOTE:** Lubricate the piston pin and retainers with clean engine oil.

Install the piston pin and the 2 piston pin retainers.

3. **NOTE:** Lubricate all the piston rings and piston oil control spacer with clean engine oil.

Install the lower piston oil control segment ring.

4. Install the piston oil control spacer.
  5. Install the upper piston oil control segment ring.
  6. Install the lower piston compression ring.
  7. Install the upper piston compression ring.
-

**Engine**

## Special Tool(s)

 ST1376-A	Compressor, Piston Ring 303-D032 (D81L-6002-C) or equivalent
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)
 ST1337-A	Installer, Connecting Rod 303-442 (T93P-6136-A)
 ST2197-A	Installer, Crankshaft Front Oil Seal 303-635
 ST1480-A	Installer, Crankshaft Rear Oil Seal 303-518 (T95P-6701-DH)
 ST1479-A	Installer, Crankshaft Rear Oil Seal 303-516 (T95P-6701-BH)
 ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A)
 ST2443-A	Lifting Bracket Set, Engine 303-DS086 (D93P-6001-A)  Includes Lifting Bracket, Engine 303-D087 and 303-D088 or equivalent
 ST1668-A	Remover/Installer, Cylinder Head 303-572 (T97T-6000-A)

#### Engine Induction System

Item	Part Number	Description
1	9439	Intake manifold gasket (2 required)
2	9424	Intake manifold
3	12A366	Ignition coil (8 required)
4	9F593	Fuel injector (8 required)
5	10884	Engine Coolant Temperature (ECT) sensor
6	8575	Coolant thermostat
7	N806807	O-ring seal
8	8594	Coolant outlet adapter
9	9F792	Fuel rail
10	9F460	Intake manifold shield
11	9E822	Throttle Body (TB)
12	9E498	Vacuum harness
13	9D477	EGR-to-exhaust manifold tube
14	9G609	Intake manifold bracket

#### Engine - Front End and Lower End

Item	Part Number	Description
1	8620	Accessory drive belt
2	8A528	Coolant pump pulley
3	19A216	Idler pulley
4	10300	Generator
5	10153	Generator bracket
6	8501	Coolant pump
7	6A341	Crankshaft thrust washer
8	6333	Crankshaft main bearing (5 required)
9	6303	Crankshaft
10	6A339	Crankshaft thrust main bearing
11	6A338	Crankshaft main bearing (4 required)
12	6325	Main bearing cap (5 required)
13	6622	Oil pump screen cover and tube
14	6675	Oil pan
15	6710	Oil pan gasket
16	6B274	Timing chain guide
17	6268	Timing chain
18	6306	Crankshaft sprocket
19	12A227	Ignition pulse ring
20	3A674	Power steering pump
21	3D673	Power steering pump pulley
22	6700	Crankshaft front seal
23	6C315	Crankshaft position sensor
24	6C086	Engine front cover
25	6B288	Camshaft position sensor
26	6L266	Timing chain tensioner

27	6316	Crankshaft damper
28	6L253	Timing chain tensioner arm
29	6268	Timing chain
30	6M289	Timing chain guide
31	6M256	Timing chain tensioner
32	6L253	Timing chain tensioner arm
33	19D629	A/C compressor
34	6621	Oil pump
35	N806201	Crankshaft keyway

### Engine - Flex Plate and Engine Lubrication

Item	Part Number	Description
1	6K318	Crankshaft rear oil seal retainer
2	6701	Crankshaft rear oil seal
3	6310	Crankshaft oil slinger
4	6375	Flywheel
5	18801	Radio ignition interference capacitor
6	18B402	Coolant bypass tube
7	6750	Oil level indicator
8	6754	Oil level indicator tube
9	6714	Oil filter

10	9278	Engine Oil Pressure (EOP) switch
11	6881	Oil filter adapter
12	6A636	Oil filter adapter gasket
13	6881	Oil filter adapter
14	6A642	Engine oil cooler

**Engine - Upper End**

Item	Part Number	Description
1	9431	Exhaust manifold
2	9Y431	Exhaust manifold gasket (2 required)
3	6051	Head gasket
4	9430	Exhaust manifold
5	9Y431	Exhaust manifold gasket (2 required)
6	6049	Cylinder head
7	6256	Camshaft sprocket
8	6265	Camshaft sprocket spacer
9	6582	Valve cover
10	6766	Oil filler cap
11	6A666	PCV valve
12	6K817	Crankcase vent connector and hose
13	6B280	Camshaft bearing cap

14	6250	Camshaft
15	12405	Spark plug (8 required)
16	18663	Heater coolant bypass tube
17	6150	Top compression ring (8 required)
18	6152	Lower compression ring (8 required)
19	6159	Top oil control ring (8 required)
20	6159	Lower oil control ring (8 required)
21	6110	Piston (8 required)
22	6135	Piston pin (8 required)
23	6161	Oil ring spacer (8 required)
24	6211	Connecting rod bearings (16 required)
25	6205	Connecting rod assembly (8 required)
26	6C070	Torque converter inspection hold cover
27	6010	Cylinder block
28	6083	Head gasket
29	6505	Exhaust valve (8 required)
30	6507	Intake valve (8 required)
31	18801	Radio capacitor
32	6A517	Valve stem seal (16 required)
33	6513	Valve spring (16 required)
34	6514	Valve spring retainer (16 required)
35	6518	Valve spring retainer key (32 required)
36	6529	Roller follower (16 required)
37	6C501	Hydraulic lash adjuster (16 required)
38	6G004	Cylinder Head Temperature (CHT) sensor
39	12A654	CHT sensor harness
40	6256	Camshaft sprocket
41	6265	Camshaft sprocket spacer
42	6A274	Camshaft
43	6B280	Camshaft bearing cap
44	6A505	Valve cover

### Assembly

#### All engines

1. Record the main bearing code found on the front of the engine block.

2. Record the main bearing code found on the back of the crankshaft.

3. Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings Chart determine the required bearing grade for each main bearing.
  - Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.
  - Read down the column below the engine main bearing code letter, and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade for the No. 1 crankshaft main bearing.
  - As an example, if the engine block code letter is "F" and the crankshaft code letter is "D," the correct bearing grade for this main bearing is "2."
  - Repeat this process for the remaining 4 main bearings.

A0041840

5. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

Lubricate with clean engine oil and install the crankshaft upper main bearings into the cylinder block.

6. Install the crankshaft onto the upper crankshaft thrust bearing and main bearings.

7. **NOTE:** To aid in assembly, apply petroleum jelly to the back of the crankshaft thrust washer.

**NOTE:** The oil groove on the thrust washer must face toward the rear of the engine (crankshaft surface).

Install the rear main bearing cap.

8. Install the crankshaft lower main bearings, thrust bearing and thrust washer into the main bearing caps. Locate the main bearing cap on the cylinder block and tap into place using a plastic or dead-blow hammer.

9. **NOTE:** The jackscrews are a part of the main bearing cap assembly and are screwed into the main caps, not the cylinder block.

Back out the 10 jackscrews against the cylinder block in 2 stages, in the sequence shown.

- Stage 1: Tighten to 5 Nm (44 lb-in).
- Stage 2: Tighten to 10 Nm (89 lb-in).

10. Install the 10 main bearing cap bolts and tighten in 2 stages, in the sequence shown.

- Stage 1: Tighten to 10 Nm (89 lb-in).
- Stage 2: Tighten to 21 Nm (15 lb-ft).

11. Tighten the 10 main bearing cap bolts in 2 stages, in the sequence shown.

- Stage 1: Tighten to 40 Nm (30 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

12. Check piston-to-cylinder block and ring clearances. For additional information, refer to [Section 303-00](#).

13. Assemble the 8 pistons. For additional information, refer to Piston in this section.

14. Make sure the ring gaps (oil spacer-A, oil ring-B, compression ring-C) are correctly spaced around the circumference of the piston.

15. Make sure the dimple in the piston faces the front of the engine.

16. **NOTICE:** Do not scratch the cylinder walls or crankshaft journals with the connecting rod or engine failure may occur.

**NOTE:** Make sure the piston arrow is facing forward.

**NOTE:** The next 3 steps are for all 8 connecting rods, rod caps and pistons. Only one connecting rod, rod cap and piston is shown.

Use the Piston Ring Compressor and Connecting Rod Installer to install the piston and connecting rod assemblies.

- Lubricate the piston and ring with clean engine oil.
- Lubricate the rod bearings with clean engine oil.
- Rotate the crankshaft as necessary.

17. **NOTICE:** Do not scratch the cylinder walls or crankshaft journals with the connecting rod.

Once the connecting rod is seated on the crankshaft journal, remove the Connecting Rod Installer.

18. **NOTICE:** The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.

**NOTE:** The connecting rod caps have a cracked design and must make mate with the connecting rod ends. Excessive bearing clearance will result if not mated correctly.

Position the lower bearing and connecting rod bearing cap, and install the 2 new bolts loosely.

19. Tighten the 16 connecting rod bearing cap bolts in 3 stages, in the sequence shown.

- Stage 1: Tighten to 23 Nm (17 lb-ft).
- Stage 2: Tighten to 43 Nm (32 lb-ft).
- Stage 3: Rotate an additional 90-120 degrees.

20. Position the oil pump and install the 3 bolts.

- Tighten to 10 Nm (89 lb-in).

**Both cylinder heads**

21. **NOTE:** The gasket sealing surfaces on the cylinder head and cylinder block must be clean. For additional information, refer to Cylinder Head in this section.

**NOTE:** The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.

**NOTE:** The new gasket has a film coating which is crucial to the gasket's ability to seat correctly. Do not scratch the gasket.

**NOTE:** RH head gasket shown, LH head gasket similar.

Install the head gaskets over the dowel pins.

22. **NOTE:** Cylinder head machining or milling is not authorized by the Ford Motor Company. Cylinder head flatness must be within 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area.

**NOTE:** The gasket sealing surfaces on the cylinder head and cylinder block must be clean. For additional information, refer to Cylinder Head in this section.

**NOTE:** The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.

**NOTE:** Do not allow the dowels to scratch the sealing of the cylinder head during cylinder head installation.

**NOTE:** RH cylinder head shown, LH cylinder head similar.

Install the cylinder head on the dowels and the head gasket. Loosely install new bolts.

23. Tighten the 10 cylinder head bolts in 6 stages, in the sequence shown.

- Stage 1: Tighten to 40 Nm (30 lb-ft).
- Stage 2: Tighten an additional 90 degrees (one-fourth turn).
- Stage 3: Loosen a minimum of one full turn (360 degrees).
- Stage 4: Tighten to 40 Nm (30 lb-ft).
- Stage 5: Tighten an additional 90 degrees (one-fourth turn).
- Stage 6: Tighten an additional 90 degrees (one-fourth turn).

24. Remove the Cylinder Head Remover/Installer from both ends of the cylinder head.

25. **NOTE:** Lubricate the O-ring seal with clean engine oil.

Install a new O-ring seal on the oil level indicator tube and install the oil level indicator tube and bolt.

- Tighten to 10 Nm (89 lb-in).

26. Install the new 8 LH exhaust manifold studs.

- Tighten to 12 Nm (106 lb-in).

27. Install a new LH exhaust manifold gasket the LH exhaust manifold and 8 new nuts.

- Tighten to 20 Nm (177 lb-in) in the sequence shown.

28. Install the new 8 RH exhaust manifold studs.

- Tighten to 12 Nm (106 lb-in).

29. Install a new RH exhaust manifold gasket the RH exhaust manifold and 8 new nuts.

- Tighten to 20 Nm (177 lb-in) in the sequence shown.

### Engines with ratcheting timing chain tensioners

30. **NOTICE:** Timing chain procedures must be followed exactly or damage to valves and pistons will result.

**NOTICE:** Do not compress the ratchet assembly. This will damage the ratchet assembly.

**NOTE:** LH shown, RH similar.

Compress each tensioner plunger, using an edge or a vise.

31. Using a small screwdriver or pick, push back and hold the ratchet mechanism.

32. While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

33. Install a paper clip into the hole of each tensioner housing to hold the ratchet assembly and plunger in during installation.

- Remove the tensioner from the vise.

### Engines with non-ratcheting timing chain tensioners

34. **NOTICE:** If one or both tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner or engine damage may occur.

Inspect the RH and LH timing chain tensioners.

- Install new tensioners as necessary.

35. **NOTICE:** Timing chain procedures must be followed exactly or damage to valves and pistons will result.

**NOTE:** LH shown, RH similar.

Compress each tensioner plunger, using a vise.

36. Install a Hydraulic Chain Tensioner Retaining Clip on the tensioner to hold the plunger in during installation.

### All engines

37. If the colored links are not visible, mark one link on one end and one link on the other end, and use as timing marks.

38. Using the Crankshaft Holding Tool, position the crankshaft.
- Remove the Crankshaft Holding Tool after crankshaft positioning.

39. Install the crankshaft sprocket, making sure the flange faces forward.

40. Install the timing chain guides.
1. Position the LH timing chain guide.
  2. Install and tighten the 2 LH bolts to 10 Nm (89 lb-in).
  3. Position the RH timing chain guide.
  4. Install and tighten the 2 RH bolts to 10 Nm (89 lb-in).

41. Rotate the RH camshaft sprocket until the timing mark is approximately at the 11 o'clock position.  
Rotate the LH camshaft sprocket until the timing mark is approximately at the 1 o'clock position.

42. Position the LH (inner) timing chain on the crankshaft sprocket, aligning the colored (marked) link with the timing mark on the sprocket.

43. Install the LH timing chain on the camshaft sprocket, aligning the colored (marked) link with the timing marks on the sprocket.

44. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

Position the LH timing chain tensioner on the dowel pin and install the LH timing chain tensioner and 2 bolts.

- Tighten to 25 Nm (18 lb-ft).

### Engines with ratcheting timing chain tensioners

45. Remove the paper clip from the LH timing chain tensioner.

### Engines with non-ratcheting timing chain tensioners

46. Remove the Hydraulic Chain Tensioner Retaining Clip from the LH timing chain tensioner.

### All engines

47. Position the RH (outer) timing chain on the crankshaft sprocket, aligning the colored (marked) link with the timing mark on the sprocket.

48. Install the RH timing chain on the camshaft sprocket, aligning the colored (marked) link with the timing marks on the sprocket.

49. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner and 2 bolts.

- Tighten to 25 Nm (18 lb-ft).

### Engines with ratcheting timing chain tensioners

50. Remove the paper clip from the RH timing chain tensioner.

### Engines with non-ratcheting timing chain tensioners

51. Remove the Hydraulic Chain Tensioner Retaining Clip from the RH timing chain tensioner.

### All engines

52. Make sure that the colored (marked) chain links are lined up with the dots on the crankshaft sprockets and the camshaft sprocket.

53. Rotate and camshaft until the lobe is in the upward position.

54. Install the Valve Spring Compressor Spacer between the valve spring coil to prevent valve stem seal damage.

55. **NOTE:** Lubricate the hydraulic lash adjusters with clean engine oil.

Install the 16 hydraulic lash adjusters in their original locations (4 shown).

56. **NOTE:** Lubricate the camshaft roller followers using clean engine oil.

**NOTE:** Position the cam lobe away from the camshaft roller follower location prior to installing each camshaft roller follower.

Install the 16 camshaft roller followers.

1. Install the Valve Spring Compressor.
2. Compress the valve spring.
3. Install the 16 camshaft roller followers in their original locations.

57. Remove the Valve Spring Compressor Spacer.

58. **NOTICE:** Only use hand tools when removing or installing the spark plugs or damage may occur to the cylinder head or spark plug.

Install all 8 spark plugs.

- Tighten to 18 Nm (159 lb-in).

59. Install the crankshaft sensor ring.

60. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

**NOTE:** RH timing chain removed for clarity.

Apply a bead of sealant along the head-to-block surface and the oil pan-to-block surface as specified.

61. Install a new engine front cover gasket on the engine front cover. Position the engine front cover onto the dowels. Install the fasteners finger-tight.

62. Tighten the 15 front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).

Item	Part Number	Description
1	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
2	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
3	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
4	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
5	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
6	W706508	Stud, hex-head pilot, M8 x 1.25 x 50 - M6 x 1 x 10
7	N808586	Stud, washer hex-head pilot, M8 x 1.25 - M6 x 1.0 x 86.35
8	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53

9	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
10	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
11	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
12	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
13	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
14	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
15	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1

63. **NOTE:** RH shown, LH similar.

Install the RH and LH engine mounts and the 6 bolts.

- Tighten to 70 Nm (52 lb-ft).

64. Lubricate the engine front cover and the front oil seal inner lip with clean engine oil.

65. Using the Crankshaft Front Oil Seal Installer, Front Cover Oil Seal Installer and Crankshaft Vibration Damper Installer, install the front oil seal.

66. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply sealant to the Woodruff key slot on the crankshaft pulley.

67. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

68. **NOTE:** Use the Strap Wrench to hold the crankshaft pulley.

Install the bolt and washer and tighten the crankshaft pulley bolt in 4 stages.

- Stage 1: Tighten to 120 Nm (89 lb-ft).
- Stage 2: Loosen 360 degrees.
- Stage 3: Tighten to 50 Nm (37 lb-ft).
- Stage 4: Rotate an additional 90 degrees (one-fourth turn).

69. **NOTICE:** Make sure the O-ring seal is in place and not damaged. A missing or damaged O-ring seal may cause foam in the lubrication system, low oil pressure and severe engine damage.

**NOTE:** Clean and inspect the mating surfaces and install a new O-ring seal. Lubricate the O-ring seal with clean engine oil.

Install the oil pump screen and pickup tube spacer.

- Tighten to 25 Nm (18 lb-ft).

70. Position the oil pump screen and pickup tube, and install the 3 bolts.

1. Tighten to 25 Nm (18 lb-ft).
2. Tighten to 10 Nm (89 lb-in).

71. Install the new oil filter adapter gasket, oil filter adapter and the 4 bolts.

- Tighten to 25 Nm (18 lb-ft) in the sequence shown.

72. **NOTICE:** The oil cooler must be replaced or severe damage to the engine can occur.

If equipped, install the new oil cooler and install the oil cooler mounting bolt.

- Tighten to 46 Nm (34 lb-ft).

73. **NOTICE:** Do not rotate the coolant pump housing once the coolant pump has been positioned in the cylinder block. Damage to the O-ring seal will occur.

Install the coolant pump.

1. Lubricate the new O-ring seal using clean engine coolant.
2. Position the coolant pump into the engine block.
3. Install the 4 bolts and tighten to 25 Nm (18 lb-ft).

74. Position the coolant pump pulley on the coolant pump and install the 4 bolts.
- Tighten to 25 Nm (18 lb-ft).

75. Position the accessory drive belt idler pulley and install the bolt.
- Tighten to 25 Nm (18 lb-ft).

76. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply sealant in 2 places where the engine front cover meets the cylinder head.

77. Install the new LH gasket into the valve cover and position on the cylinder head. Tighten the bolts in the sequence shown.
- Tighten to 10 Nm (89 lb-in).

78. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply sealant in 2 places where the engine front cover meets the cylinder head.

79. Install the new RH gasket into the valve cover and position on the cylinder head. Tighten the 11 bolts in the sequence shown.

- Tighten to 10 Nm (89 lb-in).

80. Install the Knock Sensor (KS) and the nut.

- Tighten to 20 Nm (177 lb-in).

81. **NOTE:** Lubricate the O-ring seal with clean engine coolant.

Inspect the O-rings seals. Install new seals, if necessary.

82. Install the coolant bypass tube.

83. Install the ground strap on the rear of the RH cylinder head.
1. Install the stud bolt and tighten to 25 Nm (18 lb-ft).
  2. Install the ground strap.
  3. Install the retaining nut and tighten to 10 Nm (89 lb-in).

84. Install the insert into the LH cylinder head.

85. **NOTE:** Align the gasket locator tabs to slots in cylinder head.

Install the new intake manifold gaskets, intake manifold and hand-tighten the 8 bolts at the locations shown.

86. Install the 8 ignition coils and tighten the 8 bolts (4 shown).
- Tighten to 6 Nm (53 lb-in).

87. Install the intake manifold crash bracket bolt and loosely install the bolt and the stud bolt.

88. Install the thermostat.

89. Install the coolant outlet adapter and loosely install the 2 bolts.

90. Tighten the 9 bolts in the sequence shown.

- Tighten to 25 Nm (18 lb-ft).

91. Tighten the stud bolt.

- Tighten to 25 Nm (18 lb-ft).

92. Tighten the 2 coolant outlet adapter bolts.

- Tighten to 25 Nm (18 lb-ft).

93. Connect the throttle control and throttle positioning sensor electrical connector.

94. Connect the EGR tube to the EGR valve.

- Tighten to 43 Nm (32 lb-ft).

95. Connect the EGR tube to the exhaust manifold.

- Tighten to 43 Nm (32 lb-ft).

96. Position the fuel charging wiring at 2 locations at the back of the intake manifold.

97. Install the generator and the 2 bolts.

- Tighten to 25 Nm (18 lb-ft).

98. Install the generator mounting bracket and the 4 bolts.
- Tighten to 10 Nm (89 lb-in).

99. Attach the wire harness retainer and connect the generator electrical connector.

100. Position the vacuum harness and connect the vacuum hoses for the Evaporative Emission (EVAP) canister purge valve, the main chassis hose and the EGR valve.

101. Connect the crankcase ventilation tube.

102. Install the intake manifold shield and 2 bolts.
- Tighten to 10 Nm (89 lb-in).

103. Connect the 8 fuel injector electrical connectors (4 shown).

104. Connect the 8 ignition coil electrical connectors (4 shown).

105. Connect the Camshaft Position (CMP) sensor electrical connector.

106. Connect the radio interference capacitor electrical connector.

107. Connect the KS electrical connector and install the harness retainer to the intake manifold.

108. Connect the Cylinder Head Temperature (CHT) sensor electrical connector.

109. Install the battery cables and the bolt.

110. Install the Engine Lifting Bracket to the RH cylinder head.

111. Install the Engine Lifting Bracket to the LH cylinder head.

112. Using the Engine Lifting Bracket Set, remove the engine from the engine stand.

113. **NOTE:** The rear crankshaft seal retainer plate does not have a sealant groove. Gasket maker must be applied to the rear crankshaft seal retainer mating surface on the engine block.

Apply a bead of gasket maker to the crankshaft rear seal retainer plate mating surface on the engine block.

114. Install the crankshaft rear seal retainer plate and loosely install the 6 bolts.

115. Tighten the 6 crankshaft rear seal retainer plate bolts in the sequence shown.

- Tighten to 10 Nm (89 lb-in).

116. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply the sealant at the rear oil seal retainer to cylinder block sealing surface.

117. Apply sealant at the front cover-to-cylinder block sealing surface.

118. Position the new oil pan gasket, the oil pan and the loosely install the 16 bolts.

119. Tighten the 16 bolts in 2 stages, in the sequence shown.

- Stage 1: Tighten to 20 Nm (177 lb-in).
- Stage 2: Rotate an additional 60 degrees.

120. Using the Crankshaft Rear Oil Seal Installers, install the crankshaft rear oil seal.

121. Using the Crankshaft Rear Oil Seal Installer and Crankshaft Rear Oil Slinger Installer, install the crankshaft oil slinger.

122. Install the engine/transmission spacer plate.

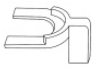

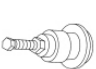

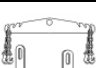

123. Position the flexplate and install the 6 bolts in the sequence shown.

- Tighten to 80 Nm (59 lb-ft).

**Cylinder Head**

## Special Tool(s)

 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)
 ST2197-A	Installer, Crankshaft Front Oil Seal 303-635
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A)
 ST2443-A	Lifting Bracket Set, Engine 303-DS086 (D93P-6001-A)  Includes Lifting Bracket, Engine 303-D087 and 303-D088 or equivalent
 ST1668-A	Remover/Installer, Cylinder Head 303-572 (T97T-6000-A)
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent

### Installation

#### Both cylinder heads

1. **NOTE:** The gasket sealing surfaces on the cylinder head and cylinder block must be clean. For additional information, refer to Cylinder Head in the Removal portion of this section

**NOTE:** The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.

**NOTE:** The new gasket has a film coating which is crucial to the gasket's ability to seal correctly. Do not scratch the gasket.

**NOTE:** RH head gasket shown, LH head gasket similar.

Install the new head gasket over the dowel pins.

2. **NOTE:** Cylinder head machining or milling is not authorized by the Ford Motor Company. Cylinder head flatness must be within 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area.

**NOTE:** The gasket sealing surfaces on the cylinder head and cylinder block must be clean. For additional information, refer to Cylinder Head in the Removal portion of this section.

**NOTE:** The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.

**NOTE:** Do not allow the dowels to scratch the sealing surface of the cylinder head during cylinder head installation.

**NOTE:** RH cylinder head shown, LH cylinder head similar.

Install the cylinder head on the dowels and the head gasket. Loosely install new bolts.

3. Tighten the cylinder head bolts in 6 stages, in the sequence shown.

- Stage 1: Tighten to 40 Nm (30 lb-ft).
- Stage 2: Tighten an additional 90 degrees (one-fourth turn).
- Stage 3: Loosen a minimum of one full turn (360 degrees).
- Stage 4: Tighten to 40 Nm (30 lb-ft).
- Stage 5: Tighten an additional 90 degrees (one-fourth turn).
- Stage 6: Tighten an additional 90 degrees (one-fourth turn).

4. Remove the Cylinder Head Remover/Installer from both ends of the cylinder head.

### LH cylinder head

5. **NOTE:** Lubricate the O-ring seal with clean engine oil.

Install a new O-ring seal on the oil level indicator tube and install the oil level indicator tube and bolt.

- Tighten to 10 Nm (89 lb-in).

6. Install the 8 new LH exhaust manifold studs.

- Tighten to 12 Nm (106 lb-in).

7. Install a new LH exhaust manifold gasket the LH exhaust manifold and 8 new nuts.

- Tighten to 20 Nm (177 lb-in) in the sequence shown.

## RH cylinder head

8. Install the 8 new RH exhaust manifold studs.
  - Tighten to 12 Nm (106 lb-in).
9. Install a new RH exhaust manifold gasket the RH exhaust manifold and 8 new nuts.
  - Tighten to 20 Nm (177 lb-in) in the sequence shown.

## Engines with ratcheting timing chain tensioners

10. **NOTICE:** Timing chain procedures must be followed exactly or damage to valves and pistons will result.

**NOTICE:** Do not compress the ratchet assembly. This will damage the ratchet assembly.

**NOTE:** LH shown, RH similar.

Compress each tensioner plunger, using an edge of a vise.

11. Using a small screwdriver or pick, push back and hold the ratchet mechanism.

12. While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

13. Install a paper clip into the hole of each tensioner housing to hold the ratchet assembly and plunger in during installation.
- Remove the tensioner from the vise.

#### Engines with non-ratcheting timing chain tensioners

14. **NOTICE:** If one or both tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner or engine damage may occur.

Inspect the RH and LH timing chain tensioners.

- Install new tensioners as necessary.

15. **NOTICE:** Timing chain procedures must be followed exactly or damage to valves and pistons will result.

**NOTE:** LH shown, RH similar.

Compress each tensioner plunger, using an edge of a vise.

16. Install a Hydraulic Chain Tensioner Retaining Clip on the tensioner to hold the plunger in during installation.

## Both cylinder heads

17. If the colored links are not visible, mark one link on one end and one link on the other end, and use as timing marks.

18. Using the Crankshaft Holding Tool, position the crankshaft.
- Remove the Crankshaft Holding Tool after crankshaft positioning.

19. Install the crankshaft sprocket, making sure the flange faces forward.

20. Install the timing chain guides.
1. Position the LH timing chain guide.
  2. Install and tighten the LH bolts to 10 Nm (89 lb-in).
  3. Position the RH timing chain guide.
  4. Install and tighten the RH bolts to 10 Nm (89 lb-in).

21. Rotate the RH camshaft sprocket until the timing mark is approximately at the 11 o'clock position.  
Rotate the LH camshaft sprocket until the timing mark is approximately at the 1 o'clock position.

22. Position the LH (inner) timing chain on the crankshaft sprocket, aligning the colored (marked) link with the timing mark on the sprocket.

23. Install the LH timing chain on the camshaft sprocket, aligning the colored (marked) link with the timing marks on the sprocket.

24. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

Position the LH timing chain tensioner on the dowel pin and install the LH timing chain tensioner.

- Tighten to 25 Nm (18 lb-ft).

25. Remove the Hydraulic Chain Tensioner Retaining Clip from the LH timing chain tensioner.

26. Position the RH (outer) timing chain on the crankshaft sprocket, aligning the colored (marked) link with the timing mark on the sprocket.

27. Install the RH timing chain on the camshaft sprocket, aligning the colored (marked) link with the timing marks on the sprocket.

28. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner.
- Tighten to 25 Nm (18 lb-ft).

29. Remove the Hydraulic Chain Tensioner Retaining Clip from the RH timing chain tensioner.

30. Make sure that the colored (marked) chain links are lined up with the dots on the crankshaft sprockets and the camshaft sprocket.

31. Rotate the camshaft until the lobe is in the upward position.

32. Install the Valve Spring Compressor Spacer between the valve spring coils to prevent valve stem seal damage.

33. **NOTE:** Lubricate the hydraulic lash adjusters with clean engine oil.

Install the 16 hydraulic lash adjusters in their original locations (4 shown).

34. **NOTE:** Lubricate the camshaft roller followers using clean engine oil.

**NOTE:** Position the cam lobe away from the camshaft roller follower location prior to installing each camshaft roller follower.

Install the camshaft roller follower.

1. Install the Valve Spring Compressor.
2. Compress the valve spring.
3. Install the camshaft roller followers in their original locations.

35. Remove the Valve Spring Compressor Spacer.

36. **NOTICE:** Only use hand tools when removing or installing the spark plugs, damage may occur to the cylinder head or spark plug.

Install all 8 spark plugs.

- Tighten to 18 Nm (159 lb-in).

37. Install the crankshaft sensor ring.

38. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply a bead of sealant along the head-to-block surface and the oil pan-to-block surface as specified.

39. Install a new engine front cover gasket on the engine front cover. Position the engine front cover onto the dowels. Install the fasteners finger-tight.

40. Tighten the front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).

Item	Part Number	Description
1	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
2	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
3	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
4	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
5	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
6	W706508	Stud, hex-head pilot, M8 x 1.25 x 50 - M6 x 1 x 10
7	N808586	Stud, washer hex-head pilot, M8 x 1.25 - M6 x 1.0 x 86.35
8	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
9	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
10	N806177	Bolt, hex flange head pilot, M8 x 1.25 x 53
11	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
12	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
13	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
14	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1
15	N806300	Stud, hex-shoulder pilot, M8 x 1.25 x 1.25 x 91.1

41. Loosely install the 4 bolts, then tighten in 2 stages in the sequence shown.

- Stage 1: Tighten to 20 Nm (177 lb-in).
- Stage 2: Tighten an additional 60 degrees.

42. **NOTE:** RH shown, LH similar.

Install the RH and LH engine mounts and the bolts.

- Tighten to 70 Nm (52 lb-ft).

43. Lubricate the engine front cover and the front oil seal inner lip with clean engine oil.

44. Using the Crankshaft Front Oil Seal Installer, Front Cover Oil Seal Installer and Crankshaft Vibration Damper Installer, install the front oil seal.

45. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply sealant to the Woodruff key slot on the crankshaft pulley.

46. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

47. **NOTE:** Use a Strap Wrench to hold the pulley.

Tighten the crankshaft pulley bolt in 4 stages.

- Stage 1: Tighten to 120 Nm (89 lb-ft).
- Stage 2: Loosen 360 degrees.
- Stage 3: Tighten to 50 Nm (37 lb-ft).
- Stage 4: Rotate an additional 90 degrees (one-fourth turn).

48. Position the coolant pump pulley on the coolant pump and install the bolts.

- Tighten to 25 Nm (18 lb-ft).

49. Install the accessory drive belt idler pulley and bolt.

- Tighten to 25 Nm (18 lb-ft).

50. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply sealant in 2 places where the engine front cover meets the cylinder head.

51. Install the new valve cover gasket into the valve cover and position on the cylinder head. Tighten the bolts in the sequence shown.

- Tighten to 10 Nm (89 lb-in).

52. **NOTICE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

Apply sealant in 2 places where the engine front cover meets the cylinder head.

53. Install the gasket into the valve cover and position on the cylinder head. Tighten the bolts in the sequence shown.

- Tighten to 10 Nm (89 lb-in).

54. Inspect the O-ring seals. Install new seals if necessary.

55. Install the coolant bypass tube.

56. Install the ground strap on the rear of the RH cylinder head.
1. Install the stud bolt and tighten to 25 Nm (18 lb-ft).
  2. Install the ground strap.
  3. Install the retaining nut and tighten to 10 Nm (89 lb-in).

57. Install the insert into the LH cylinder head.

58. **NOTE:** Align the gasket locator tabs to slots in cylinder head.

Install the new intake manifold gaskets, intake manifold and hand-tighten the bolts at the locations shown.

59. Install the 8 ignition coils and tighten the 8 bolts (4 shown).
- Tighten to 6 Nm (53 lb-in).

60. Install the intake manifold bracket and loosely install the bolt and the stud bolt.

61. Install the thermostat.

62. Install the coolant outlet adapter and loosely install the 2 bolts.

63. Tighten the bolts in the sequence shown.
- Tighten to 25 Nm (18 lb-ft).

64. Tighten the stud bolt.

- Tighten to 25 Nm (18 lb-ft).

65. Tighten the bolts.

- Tighten to 25 Nm (18 lb-ft).

66. Connect the EGR tube to the EGR valve.

- Tighten to 43 Nm (32 lb-ft).

67. Connect the EGR tube-to-exhaust manifold connector.

- Tighten to 43 Nm (32 lb-ft).

68. Position the fuel charging wiring at 2 locations at the back of the intake manifold.

69. Install the generator and the 2 bolts.
- Tighten to 25 Nm (18 lb-ft).

70. Connect the throttle control and the Throttle Position (TP) sensor electrical connector.

71. Install the generator mounting bracket and the 4 bolts.
- Tighten to 10 Nm (89 lb-in).

72. Attach the wire harness retainer and connect the generator electrical connector.

73. Connect the electrical connector to the EGR vacuum regulator solenoid.

74. Connect the crankcase ventilation tube.

75. Install the intake manifold shield and the 2 bolts.

- Tighten to 10 Nm (89 lb-in).

76. Connect the 8 fuel injector electrical connectors (4 shown).

77. Connect the 8 ignition coil electrical connectors.

78. Connect the Camshaft Position (CMP) sensor electrical connector.

79. Connect the radio interference capacitor electrical connector.

80. Connect the Cylinder Head Temperature (CHT) sensor electrical connector.

81. Install the battery cables and the bolt.

82. Install the Engine Lifting Bracket to the RH cylinder head.

83. Install the Engine Lifting Bracket to the LH cylinder head.

84. Using the Engine Lifting Bracket Set, remove the engine from the engine stand.

85. Install the engine/transmission spacer plate.

86. Position the flexplate and install the bolts in the sequence shown.

- Tighten to 80 Nm (59 lb-ft).

87. Install the engine. For additional information, refer to Engine in the Installation portion of this section.

88. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system.  
**For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system

**Engine**

## Special Tool(s)

	Lifting Bracket Set, Engine 303-DS086 (D93P-6001-A) or equivalent
	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

## Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Using the Engine Lifting Bracket Set, install the engine assembly in the vehicle.

3. **NOTE:** When vehicle is raised, verify that the torque converter is correctly seated.

Install the 4 transmission bellhousing bolts (2 shown) and 1 stud.

- Tighten to 48 Nm (35 lb-ft).

4. Attach the wiring harness to the retainers on the transmission.

5. Connect the Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor and the Turbine Shaft Speed (TSS) sensor electrical connectors.

6. Connect the Heated Oxygen Sensor (HO2S) and the solenoid body sensor electrical sensors.

7. Raise the transmission and install the transmission insulator.

8. Install the 2 insulator bolts.

- Tighten to 90 Nm (66 lb-ft).

9. Lower the transmission and install the 2 transmission insulator nuts.

- Tighten to 30 Nm (22 lb-ft).

10. **NOTE:** LH shown, RH similar.

Install the 2 engine mount nuts.

- Tighten to 90 Nm (66 lb-ft).

11. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the HO2S .

Using the Exhaust Gas Oxygen Sensor Socket, install the HO2S .

- Calculate the correct torque wrench setting for the following torque. For additional information, Refer to the Torque Wrench Adapter Formulas in the Appendix.
- Tighten to 40 Nm (30 lb-ft).

12. Connect the LH HO2S electrical connector.

13. Connect the RH HO2S electrical connector.

14. Install the 4 torque converter nuts.

- Rotate the crankshaft to access the nuts.
- Tighten to 36 Nm (27 lb-ft).

15. Install the rubber access plug.

16. Install the inspection cover and the 3 bolts.

- Tighten to 19 Nm (168 lb-in).

17. Install the starter motor. For additional information, refer to [Section 303-06](#) .

18. Position the exhaust, install the 4 new nuts and remove the support.

- Tighten to 48 Nm (35 lb-ft).

19. Install the power steering pump and the 3 bolts.

- Tighten to 25 Nm (18 lb-ft).

20. Install the A/C compressor and the 3 bolts.

- Tighten to 25 Nm (18 lb-ft).

21. Connect the A/C compressor electrical connector.

22. Connect the engine wiring harness retainers to the A/C compressor.

23. Connect the Crankshaft Position (CKP) sensor electrical connector.

24. Position the transmission oil cooler tube bracket and install the bolt.  
• Tighten to 15 Nm (133 lb-in).

25. Install the transmission cooler tube support bracket.  
• Tighten to 9 Nm (80 lb-in).

26. Install the power steering tube bracket.

- Tighten to 10 Nm (89 lb-in).

27. If equipped, connect the 2 coolant hoses to the oil cooler.

- Align the white lines on the coolant hoses with the black dots on the cooler tubes.

28. Connect the Power Steering Pressure (PSP) switch electrical connector.

29. Connect the power steering electrical connector.

30. If equipped, connect the block heater electrical connector.

31. Connect the EOP switch electrical connector.

32. Install the 2 top transmission bellhousing bolts.
- Tighten to 48 Nm (35 lb-ft).

33. **NOTE:** Lubricate the oil filter seal with clean engine oil.

Install the oil filter.

34. Install the cooling fan. For additional information, refer to [Section 303-03](#).

35. **NOTE:** Do not reuse hose clamps. Use appropriately sized worm-style clamps in place of the constant tension clamps.

Connect the lower radiator hose.

36. Connect the upper radiator hose to the hose connection.

37. Connect the PCM electrical connectors.

38. Position the ground strap and install the bolt.

- Tighten to 10 Nm (89 lb-in).

39. **NOTE:** Do not reuse hose clamps. Use appropriately sized worm-style clamps in place of the constant tension clamps.

Connect the heater hoses.

40. Connect the A/C low charge protection switch electrical connector.

41. Connect the A/C electrical connector.

42. Install the ground strap and the bolt.

- Tighten to 10 Nm (89 lb-in).

43. Attach the pin-type retainer and install the generator battery cable and nut.

- Tighten to 9 Nm (80 lb-in).

44. Attach the generator battery cable retainer to the RH valve cover stud bolt.

45. Connect the fuel tube spring lock coupling. For additional information, refer to [Section 310-00](#).

46. Connect the 2 hoses and the Evaporative Emission (EVAP) canister purge valve electrical connection.

47. Connect the vacuum hose.

48. Install the Air Cleaner (ACL) and outlet pipe. For additional information, refer to [Section 303-12](#).

49. Install the accessory drive belt. For additional information, refer to [Section 303-05](#).

50. Install the support bracket and the 2 nuts.

- Tighten to 10 Nm (89 lb-in).

51. Install the wiper mounting arm and pivot shaft. For additional information, refer to [Section 501-16](#).

52. Fill the crankcase with clean engine oil.
53. Connect both battery cables. For additional information, refer to Section 414-00 .
54. Fill and bleed the cooling system. For additional information, refer to Section 303-03 .
55. Install the hood.
56.  **WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

---

## Material

Item	Specification	Fill Capacity
Motorcraft® Metal Surface Prep ZC-31-A	-	-
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1	17.9L (18.9qt)
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A	-

## General Specifications

Item	Specification
<b>Pressure Tests</b>	
Complete cooling system maximum pressure	110 kPa (16 psi)
Pressure relief cap (opening pressure)	110 kPa (16 psi)
Radiator (out of vehicle)	138 kPa (20 psi)
<b>Thermostat Opening Temperatures</b>	
Starts to open	87-91°C (188-195°F)
Fully open	100°C (212°F)

## Torque Specifications

Description	Nm	lb-ft	lb-in
A/C condenser-to-radiator bolt	10	-	89
Block heater screw	2	-	18
Coolant outlet adapter bolts	25	18	-
Coolant pump bolts	25	18	-
Coolant pump pulley bolts	25	18	-
Cooling fan motor and shroud bolts	10	-	89
Degas bottle bolt	10	-	89
Power steering reservoir bolt	10	-	89
Radiator support bracket bolts	10	-	89

## Engine Cooling

**NOTICE:** The cooling system is filled with Motorcraft® Premium Gold Engine Coolant or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Always fill the cooling system with the manufacturer's specified coolant. If a non-specified coolant has been used the cooling system must be chemically flushed. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.

**NOTE:** If cooling system stop leak pellets are used, Motorcraft Premium Gold Engine Coolant may darken from yellow to golden tan.

The cooling system consists of the following components:

- Block heater (if equipped)
- Engine Coolant Temperature (ECT) sensor
- Fan blade, fan motor and fan shroud assembly
- Radiator
- Pressure relief cap
- Radiator draincock
- Coolant pump
- Coolant temperature indicator sender unit
- Coolant thermostat
- Oil filter adapter
- Radiator overflow hose

The radiator allows excess engine heat to be transferred to the air.

Radiator tanks cannot be repaired.

Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water. A coolant concentration of 50% will provide freeze point protection down to -37°C (-34°F).

To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft® Premium Gold Engine Coolant or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color).
- Do not add or mix different coolant types. Mixing coolants degrades the coolant's corrosion protection.
- Do not add alcohol, methanol, brine or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles equipped with Motorcraft® Premium Gold Engine Coolant since a Ford-approved recycling process is not yet available.

### Coolant Flow Diagram - Without Oil Cooler

**NOTE:** Black arrows indicate hot, white arrows indicate cold.

Item	Part Number	Description
1	8W005	Degas bottle-to-radiator hose

## Material

Item	Specification
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1

**Principles of Operation**

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine-generated heat to the outside air.

The degas bottle holds surplus coolant and removes air from the cooling system, which reduces hot spots. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the location for service fill.

The cooling fan draws air through the radiator to help cool the system coolant as it passes through the radiator.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor will be executed once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 is set, and the Malfunction Indicator Lamp (MIL) will be illuminated.

For vehicle/engine specific information, refer to Engine Cooling in the Description and Operation portion of

this section.

### Inspection and Verification

**⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

**NOTICE:** The engine cooling system is filled with Motorcraft® Premium Gold Engine Coolant. Mixing coolant types degrades the corrosion protection of Motorcraft® Premium Gold Engine Coolant. Do not mix coolant types. Failure to follow these instructions may result in engine or cooling system damage.

**NOTE:** Vehicles have the pressure relief cap on the degas bottle and no radiator cap.

1. Verify the customer concern.
2. Visually check the engine coolant level at the degas bottle or coolant expansion tank when the system is cold.
3. Make sure the pressure relief cap is installed correctly.
4. Record any cooling system DTCs retrieved. Refer to the PCM DTC Chart in this section for DTC descriptions.
5. **NOTE:** Take note of any coolant odor or steam coming from cooling system components.

If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer's concern by operating the engine to duplicate the condition.

6. **NOTE:** Refer to the coolant flow diagram in the Description and Operation Engine Cooling portion of this section.

Inspect to determine if any of the following mechanical or electrical concerns apply.

### Visual Inspection Chart

**Visual Inspection Chart**

<b>Mechanical</b>	<b>Electrical</b>
<ul style="list-style-type: none"> <li>• Cracked or damaged: <ul style="list-style-type: none"> <li>◆ Hoses</li> <li>◆ Tubes</li> <li>◆ Hose clamps</li> <li>◆ Thermostat housing</li> <li>◆ Radiator</li> <li>◆ Pressure relief cap</li> <li>◆ Cooling fan</li> <li>◆ Coolant pump</li> <li>◆ Degas bottle</li> <li>◆ Oil cooler (if equipped)</li> <li>◆ Cylinder block core plugs</li> <li>◆ Cylinder head core plugs</li> <li>◆ Block heater (if equipped)</li> </ul> </li> <li>• Restricted airflow through the A/C condenser/radiator</li> <li>• Drive belt loose, worn or installed incorrectly</li> <li>• Broken or weak drive belt tensioner</li> <li>• Excessive white or light gray exhaust smoke (may have burnt coolant odor)</li> <li>• Coolant in engine oil</li> <li>• Engine oil in coolant</li> </ul>	â

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.

8. Inspect the coolant condition in the following sequence:

1. Inspect the coolant color.

- ◆ If Motorcraft® Premium Gold Engine Coolant has a clear or pale yellow color, this indicates higher water content than required. Test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range -45°C to -23°C (-49°F to -9°F). If the vehicle is driven in cold climates less than -36°C (-33°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
- ◆ A pale green color indicates incorrect coolant (green in color) may have been added to the system. Use of incorrect (green in color) coolant degrades the corrosion

protection of Motorcraft® Premium Gold Engine Coolant. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Premium Gold Engine Coolant.

- ◆ **NOTE:** If cooling system stop leak pellets are used, Motorcraft Premium Gold Engine Coolant may darken from yellow to golden tan.

Dark brown coolant could indicate a commercially available stop leak may have been used. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Premium Gold Engine Coolant.

- ◆ A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Premium Gold Engine Coolant.
- ◆ An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For information on engine diagnosis, refer to Section 303-00.
- ◆ A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to Component Tests in this section. If engine oil is suspected, the cause of the leak may be internal to the engine. Refer to Section 303-00.

2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range -45°C to -23°C (-49°F to -9°F). If the vehicle is driven in cold climates less than -36°C (-33°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
  - ◆ Maximum coolant concentration is 60/40 for cold weather areas.
  - ◆ Minimum coolant concentration is 40/60 for warm weather areas.
3. Adjust coolant range and level if necessary:
  - ◆ If coolant is low, add specified coolant mixture only.
  - ◆ If the engine coolant tests too weak, remove some of the engine coolant and add undiluted engine coolant until the readings are within acceptable levels.
  - ◆ If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9. If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

10. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

11. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM.
- refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

12. If the scan tool does not communicate with the vehicle:
  - verify the ignition key is in the ON position.
  - verify the scan tool operation with a known good vehicle.
  - refer to Section 418-00 to diagnose no response from the PCM.

13. Carry out the network test.

- If the scan tool responds with no communication for one or more modules, refer to [Section 418-00](#) .
- If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

14. Clear the continuous DTCs and carry out the self-test diagnostics PCM.

15. If the DTCs recovered are related to the concern, go to the PCM DTC Chart. For all other DTCs, refer to [Section 419-10](#) .

16. If no DTCs related to the concern are retrieved, GO to [Symptom Chart](#) .

## Symptom Chart

Symptom Chart

### Pinpoint Tests

#### Pinpoint Test A: Loss of Coolant

##### Normal Operation

The engine cooling system is a closed system that provides for coolant expansion and contraction and also changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps are used to contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Normal Operation

Coolant loss can be attributed to either external or internal leaks anywhere within the cooling system.

For vehicle/engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

**This pinpoint test is intended to diagnose the following:**

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal or gasket
- Coolant pump O-ring seal or gasket
- Thermostat housing
- Radiator
- Pressure relief cap
- Coolant pump leaking from weep hole
- Heater core
- Engine gaskets
- Oil cooler (if equipped)
- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)

**PINPOINT TEST A: LOSS OF COOLANT**

**⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
<b>A1 CARRY OUT INSPECTION AND VERIFICATION</b>	
<ul style="list-style-type: none"> <li>• Carry out the Inspection and Verification procedure in this section.</li> <li>• <b>Were any concerns found?</b></li> </ul>	<p><b>Yes</b> REPAIR as needed. TEST the system for normal operation.</p> <p><b>No</b> GO to <u>A2</u> .</p>

<ul style="list-style-type: none"> <li>• Remove the oil level indicator from the engine.</li> <li>• <b>Is coolant evident in the oil?</b></li> </ul>	<b>Yes</b> GO to <a href="#">Section 303-00</a> for engine diagnosis.  <b>No</b> GO to <a href="#">A6</a> .
<b>A6 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES</b>	
<ul style="list-style-type: none"> <li>• <b>NOTE:</b> Use UViewÂ® Combustion Leak Tester, part No. UVU560000-R or equivalent.</li> <li>• Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.</li> <li>• <b>Are combustion gases present?</b></li> </ul>	<b>Yes</b> GO to <a href="#">Section 303-00</a> for engine diagnosis.  <b>No</b> The cooling system is operational.

## Pinpoint Test B: The Engine Overheats

### Normal Operation

The engine cooling system functions to maintain engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine-generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine-generated heat to the outside air through the radiator.

For vehicle/engine specific information, refer to [Engine Cooling](#) in the Description and Operation portion of this section.

- DTC P0217 (Engine Coolant Overtemperature Condition) â Indicates an engine overheat condition was sensed by the Cylinder Head Temperature (CHT) sensor.
- DTC P1225 (Cylinder Head Overtemperature Condition) â Indicates an engine overheat condition was sensed by the CHT sensor.
- DTC P1299 (Cylinder Head Overtemperature Protection Active) â Indicates an engine overheat condition was detected by the CHT sensor. A failure mode effects management strategy called fail-safe cooling was activated to cool the engine.

**This pinpoint test is intended to diagnose the following:**

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components
- Electric cooling fan
- Engine Coolant Temperature (ECT) indicator system (gauge)
- CHT sensor
- Heater core
- Coolant pump
- Coolant flow restriction

**PINPOINT TEST B: THE ENGINE OVERHEATS**

**⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
<b>B1 CARRY OUT INSPECTION AND VERIFICATION</b>	
<ul style="list-style-type: none"> <li>• Carry out the Inspection and Verification procedure in this section.</li> <li>• <b>Were any concerns found?</b></li> </ul>	<p><b>Yes</b> REPAIR as needed. TEST the system for normal operation.</p> <p><b>No</b> GO to <b>B2</b> .</p>
<b>B2 CHECK FOR DTCs</b>

<ul style="list-style-type: none"> <li>• Remove the oil level indicator from the engine.</li> <li>• <b>Is coolant evident in the oil?</b></li> </ul>	<p><b>Yes</b> GO to <u>Section 303-00</u> for engine diagnosis.</p> <p><b>No</b> GO to <u>B8</u> .</p>
<b>B8 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES</b>	
<ul style="list-style-type: none"> <li>• <b>NOTE:</b> Use UView<sup>®</sup> Combustion Leak Tester, part No. UVU560000-R or equivalent.</li> <li>• Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.</li> <li>• <b>Are combustion gases present?</b></li> </ul>	<p><b>Yes</b> GO to <u>Section 303-00</u> for engine diagnosis.</p> <p><b>No</b> GO to <u>B9</u> .</p>

<b>B9 CHECK COOLANT CONDITION</b>	
<ul style="list-style-type: none"> <li>• Check the coolant for dirt, rust or contamination and check the coolant concentration.</li> <li>• <b>Is the coolant condition OK?</b></li> </ul>	<p><b>Yes</b> GO to <b>B10</b> .</p> <p><b>No</b> FLUSH the engine cooling system. REFER to <u>Cooling System Flushing</u> in this section. TEST the system for normal operation.</p>
<b>B10 CHECK THE ELECTRIC COOLING FAN OPERATION</b>	
<ul style="list-style-type: none"> <li>• Start the engine.</li> <li>• Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position.</li> <li>• <b>Did the electric cooling fan operate?</b></li> </ul>	<p><b>Yes</b> GO to <b>B11</b> .</p> <p><b>No</b> DIAGNOSE the electric cooling fan operation. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.</p>
<b>B11 CHECK THE COOLANT PUMP OPERATION</b>	
<ul style="list-style-type: none"> <li>• Start the engine.</li> <li>• Allow the engine to run for 10 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose.</li> <li>• <b>Is the heater outlet hose hot?</b></li> </ul>	<p><b>Yes</b> GO to <b>B12</b> .</p> <p><b>No</b> INSTALL a new coolant pump. TEST the system for normal operation.</p>
<b>B12 CHECK THE THERMOSTAT OPERATION</b>	
<ul style="list-style-type: none"> <li>• Start the engine.</li> <li>• Allow the engine to run for 10 minutes. Feel the upper radiator hose.</li> <li>• <b>Is the upper radiator hose hot?</b></li> </ul>	<p><b>Yes</b> CHECK the engine coolant temperature gauge operation. REFER to <u>Section 413-01</u> .</p> <p><b>No</b> GO to <b>B13</b> .</p>
<b>B13 VISUALLY INSPECT THE THERMOSTAT</b>	
<ul style="list-style-type: none"> <li>• Carry out the Thermostat Visual Inspection in the Component Tests portion of this section.</li> <li>• <b>Is the thermostat damaged?</b></li> </ul>	<p><b>Yes</b> INSTALL a new thermostat. TEST the system for normal operation.</p> <p><b>No</b> INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.</p>

**Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature**

## Normal Operation

The engine cooling system functions to maintain engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions, or when the electric cooling fans operate all the time. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

For vehicle/engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

- DTC P0125 (Insufficient Coolant Temp for Closed Loop Fuel Control) â Indicates the Cylinder Head Temperature (CHT) sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
- DTC P0128 (Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)) â Indicates that the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

### **This pinpoint test is intended to diagnose the following:**

- Low coolant level
- Thermostat
- Engine Coolant Temperature (ECT) indicator system (gauge)
- Engine cooling fan

## **PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE**

**⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
<b>C1 CARRY OUT INSPECTION AND VERIFICATION</b>	
<ul style="list-style-type: none"> <li>• Carry out the Inspection and Verification procedure in this section.</li> </ul>	<b>Yes</b> REPAIR as needed. TEST the system for normal operation.  <b>No</b>

<ul style="list-style-type: none"> <li>• Were any concerns found?</li> </ul>	GO to <u>C2</u> .
<b>C2 CHECK FOR DTCs P0125 or P0128</b>	
<ul style="list-style-type: none"> <li>• Check for DTC P0125 or P0128.</li> <li>• Is DTC P0125 or P0128 present?</li> </ul>	<p><b>Yes</b> GO to <u>C3</u> .</p> <p><b>No</b> The cooling system is operational. If an inoperative engine coolant temperature gauge is suspected, CHECK the engine coolant temperature gauge operation. REFER to <u>Section 413-01</u> . If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to <u>Section 412-00</u> . If any other DTCs are retrieved, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.</p>
<b>C3 CHECK THE ELECTRIC COOLING FAN OPERATION</b>	
<ul style="list-style-type: none"> <li>• Allow the engine to cool.</li> <li>• Make sure the A/C switch is OFF (if equipped).</li> <li>• Start the engine.</li> <li>• Check the electric cooling fan.</li> <li>• Is the electric cooling fan on all the time?</li> </ul>	<p><b>Yes</b> DIAGNOSE the electric cooling fan operation. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.</p> <p><b>No</b> GO to <u>C4</u> .</p>
<b>C4 CHECK THE COOLANT LEVEL</b>	
<ul style="list-style-type: none"> <li>• <b>NOTE:</b> Allow the engine to cool before checking the coolant level.</li> <li>• Visually check the engine coolant level in the degas bottle.</li> <li>• Is the engine coolant level within specification?</li> </ul>	<p><b>Yes</b> INSTALL a new thermostat. TEST the system for normal operation.</p> <p><b>No</b> <u>GO to Pinpoint Test A</u> to diagnose a coolant leak.</p>

## Component Tests

### Cooling System Pressure Test

**⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

**NOTE:** Vehicles have the pressure relief cap on the degas bottle and no radiator cap.

1. Turn the engine OFF.
2. Check the engine coolant level. Adjust the coolant level as necessary.

3. Attach the Pressure Test Kit to the degas bottle nipple and overflow hose. Install a pressure test pump to the quick connect fitting of the test adapter.

4. **NOTICE:** Do not pressurize the cooling system beyond the maximum pressure listed in the specifications table in this section or cooling system components may be damaged.

**NOTE:** If the plunger of the pressure tester is depressed too fast, an erroneous pressure reading will result.

Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained. If the pressure reading exceeds the maximum cap pressure listed in the specifications table, install a new pressure relief cap.

5. If the system does not hold pressure, remove the pressure relief cap and wash in clean water to dislodge all the foreign material from the gasket. Check the sealing surface in the filler neck of the degas bottle for nicks or cuts. Install the pressure relief cap.
6. Pressurize the engine cooling system as described in Step 4 above. Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.
7. If no leaks are found and the pressure drops, the pressure relief cap may be leaking. Install a new pressure relief cap and retest the system.
8. If no leaks are found after a new pressure relief cap is installed, and the pressure drops, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to Section 303-00 to diagnose the engine.
9. Release the system pressure by loosening the pressure relief cap. Check the coolant level and adjust as necessary.

## Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test A, B or C
- Thermostat Visual Inspection

## Thermostat Visual Inspection

1. Remove the thermostat.
2. Examine the thermostat for signs of damage including:
  - Valve not fully seated (light visible through the valve)
  - Foreign material lodged in the main valve
  - Bent or broken frame or flange
  - Bent or broken spring
  - Bent or broken valve or valve stem
  - Wax leaking from wax reservoir or a bulge in the reservoir
  - Any other damage or distortion
3. **NOTE:** If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.
4. If no damage is found during the inspection, continue troubleshooting the system concern. Go to the Symptom Chart for further instructions.

#### **Radiator Leak Test, Removed From Vehicle**

**NOTICE:** Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.

**NOTE:** Clean the radiator before leak testing to avoid contamination of tank.

1. Leak test the radiator in clean water with pressurized air to the maximum pressure listed in the Specifications.
-

**Cooling System Draining, Filling and Bleeding**

## Special Tool(s)

 ST1720-A	Battery/Antifreeze Tester 014-R1060 or equivalent
 ST2816-A	RADKITPLUS 078-00497

## Material

Item	Specification
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1

**Draining**

**⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

**NOTICE:** The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated it must be recycled or disposed of correctly and replaced. Using contaminated coolant may damage cooling system components or the engine.

**NOTICE:** Vehicle cooling systems are filled with Motorcraft® Premium Gold Engine Coolant or equivalent (yellow color) meeting Ford specification WSS-M97B51-A1. Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types. Mixing coolants may degrade the coolant's corrosion protection.

**NOTE:** Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires the system flush and replacement.

1. Release the pressure in the cooling system by slowly turning the pressure relief cap 1/2 turn counterclockwise. When the pressure is released, remove the pressure relief cap.
2. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#). Failure to follow the instructions may result in serious personal injury.

Place a suitable container below the radiator draincock and drain the radiator.

3. Close the radiator draincock.

4. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

### Filling and Bleeding with RADKITPLUS

1. Install the RADKITPLUS and follow the manufacturer's instructions to fill and bleed the cooling system.

### Filling and Bleeding without RADKITPLUS

**NOTICE:** Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

**When adding engine coolant, use a 50/50 mixture of clean, drinkable water and engine coolant.**

**To maintain the integrity of the coolant and the cooling system:**

- Add Motorcraft® Premium Gold Engine Coolant or equivalent (yellow color) meeting Ford specification WSS-M97B51-A1. Always fill the cooling system with the same type of coolant that was drained from the system. Do not mix coolant types. Mixing coolant types may degrade the coolant's corrosion protection.
- Do not add orange-colored Motorcraft® Specialty Orange Engine Coolant or equivalent meeting Ford specification WSS-M97B44-D. Mixing coolants may degrade the coolant's corrosion protection.
- Do not add alcohol, methanol, brine or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles.

1. **⚠ WARNING: Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.**

Remove the thermostat. For additional information, refer to Thermostat in this section.

2. Disconnect the heater core coolant supply hose from the fitting at the rear of the manifold.
3. Add the coolant/water mixture through the thermostat opening until coolant appears at the heater core coolant supply outlet fitting at the rear of the manifold.

4. Install the heater hose, using an appropriately sized worm style clamp in place of the constant tension clamp.

5. Install the thermostat. For additional information, refer to Thermostat in this section.
6. Add the correct engine coolant mixture to the degas bottle until the coolant level is between the COOLANT FILL LEVEL marks and replace the pressure cap.
7. Select the maximum heater temperature and blower motor speed settings. Position the control to discharge air at the A/C vents in the instrument panel.
8. Run the engine until it reaches operating temperature.
9. **⚠ WARNING: If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.**

If equipped with a fire suppression system, repower the system.

10. **NOTICE: If air discharge remains cool and the engine coolant temperature gauge does not move, the engine coolant level is low in the engine and must be filled. Stop the engine, allow it to cool and fill the cooling system. Failure to follow these instructions may result in damage to the engine.**

Add the correct engine coolant mixture to the degas bottle until the coolant level is between the COOLANT FILL LEVEL marks.

11. Repeat the 2 previous steps until the engine coolant mixture is between the COOLANT FILL LEVEL marks on the degas bottle. Turn off the engine and allow it to cool.
  12. Check the freeze protection of the engine coolant mixture with the Battery/Antifreeze Tester or equivalent. Adjust freezing point range if necessary. For additional information, refer to Engine Cooling in this section.
-

**Cooling System Flushing**

## Material

Item	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

**⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the coolant thermostat. For additional information, refer to Thermostat in this section.
3. Install the coolant hose connection without the coolant thermostat.
4. **NOTE:** Refer to the cooling system flusher manufacturer's operating instructions for specific vehicle hook-up.

Using an appropriate cooling system flusher, flush the engine and radiator.

Use Premium Cooling System Flush or equivalent meeting Ford specification. Always flush the cooling system with water thoroughly after using the flush and prior to filling the cooling system. Always fill the cooling system with the same coolant that was present in the system. Do not mix coolant types.

5. Install the coolant thermostat. For additional information, refer to Thermostat in this section.
6. Backflush the heater core. For additional information, refer to Heater Core Backflushing in this section.
7. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
8. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

---

**Heater Core Backflushing**

## Material

Item	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in Section 100-02B . Failure to follow the instructions may result in serious personal injury.

**⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. **NOTE:** For additional information, refer to the cooling system flusher manufacturer's operating instructions for particular vehicle hook-up.

Use an appropriate cooling system flusher to backflush the heater core. Use Premium Cooling System Flush or equivalent meeting Ford specification. Flush with water thoroughly after using VC-1 or equivalent prior to refilling the cooling system.

3. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
4. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

If equipped with a fire suppression system, repower the system.

---

**Block Heater**

Item	Part Number	Description
1	6B019	Block heater electrical connector
2	6A051	Block heater retaining screw
3	6A051	Block heater

**Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

With vehicle in NEUTRAL, position it on a hoist. For additional information, refer to [Section 100-02A](#) .

2. Drain the cooling system. For additional information, refer to [Cooling System Draining, Filling and Bleeding](#) in this section.
3. Disconnect the block heater electrical connector and position aside.
4. **NOTE:** Do not loosen the block heater retaining screw more than necessary for removal.

Loosen the block heater retaining screw and remove the block heater.

- To install, tighten to 2 Nm (18 lb-in).

5. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.

**NOTICE:** Make sure the block heater electrical connector is routed and secured away from rotating or hot components, or damage to the cable can occur.

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
-

**Thermostat**

## Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

Item	Part Number	Description
1	W704693	Coolant outlet adapter bolts (2 required)
2	8594	Coolant outlet adapter
3	N806807	O-ring seal
4	8575	Thermostat

**Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

Drain the cooling system. For additional information, refer to [Cooling System Draining, Filling and Bleeding](#) in this section.

2. Remove the 2 bolts and position aside the coolant outlet adapter and hose.
  - To install, tighten to 25 Nm (18 lb-ft).
3. Remove the O-ring seal and the coolant thermostat from the intake manifold.
  - Discard the O-ring seal.
  - Clean all sealing surfaces with metal surface prep.
4. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to [Section 100-02B](#) . Failure to follow these instructions may result in serious personal injury.

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

5. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
-

**Coolant Pump**

## Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1

Item	Part Number	Description
1	N806282	Coolant pump pulley bolt (4 required)
2	8A528	Coolant pump pulley
3	N806177	Coolant pump bolt (4 required)
4	8501	Coolant pump
5	391108	Coolant pump O-ring seal

**Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in [Section 100-02B](#) . Failure to follow the instructions may result in serious personal injury.

Drain the cooling system. For additional information, refer to [Cooling System Draining, Filling and Bleeding](#) in this section.

2. Loosen the 4 coolant pump pulley bolts.
3. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#) .
4. Remove the 4 bolts and the coolant pump pulley.
  - To install, tighten to 25 Nm (18 lb-ft).
5. Remove the 4 bolts and the coolant pump.

- Discard the O-ring seal.
- To install, tighten to 25 Nm (18 lb-ft).

6.  **WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to Section 100-02B . Failure to follow these instructions may result in serious personal injury.

**NOTICE:** Do not rotate the coolant pump housing once installed in the engine. Damage to the O-ring seal can occur, causing the coolant pump to leak.

**NOTE:** Align the mounting holes in the cylinder block with the mounting holes on the coolant pump prior to installing the coolant pump in the cylinder block.

**NOTE:** Install a new O-ring seal and lubricate with clean engine coolant.

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

- Clean all sealing surfaces with metal surface prep.

7. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
-

SECTION 303-03: Engine Cooling  
REMOVAL AND INSTALLATION

2010 Crown Victoria, Grand Marquis Workshop Manual  
Procedure revision date: 08/19/2009

## Radiator

### Radiator (View 1 of 2)

Item	Part Number	Description
1	8B273	Lower radiator hose
2	W505424	Radiator support bracket bolt (2 required)
3	8A194	Radiator support bracket (2 required)

### Radiator (View 2 of 2)

Item	Part Number	Description
1	W505428	A/C condenser-to-radiator bolt

2	3D746	Power steering fluid cooler
3	19E908	A/C condenser
4	8005	Radiator
5	-	Power steering fluid cooler tube bracket
6	41201	Power steering fluid cooler pin-type retainer
7	7T028	Transmission cooler tube

### Removal and Installation

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B** . Failure to follow the instructions may result in serious personal injury.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **Section 100-02A** .

2. Remove the cooling fan motor and shroud assembly. For additional information, refer to Cooling Fan Motor and Shroud in this section.
3. Remove the 3 pin-type retainers and remove the radiator sight shield.

4. Disconnect the lower radiator hose and position aside.
5. Remove the 2 bolts and the 2 radiator support brackets.
  - To install, tighten to 10 Nm (89 lb-in).
6. **NOTE:** LH shown, RH similar.

Remove the top 2 LH and 2 RH pin-type retainers from the A/C condenser air deflectors.

7. Disconnect the transmission cooler tubes from the transmission cooler and position aside.
  - To install, tighten to 20 Nm (177 lb-in).
8. Remove the pin-type retainer from radiator-to-power steering fluid cooler.
9. Remove the bolt from the A/C condenser.
  - To install, tighten to 10 Nm (89 lb-in).
10. Release the 2 retainer clips and separate the power steering fluid cooler from the radiator.

11. **NOTE:** LH shown, RH similar.

Separate the A/C condenser from the radiator by sliding from right to left.

- Remove the radiator.

12. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to **Section 100-02B** . Failure to follow these instructions may result in serious personal injury.

**NOTE:** Do not reuse hose clamps. Instead, use appropriately sized worm-style clamps in place of the constant tension clamps.

To install, reverse the removal procedure.

13. Fill and bleed the cooling system. For additional information, refer to **Cooling System Draining, Filling and Bleeding** in this section.

14. Fill the transmission to the correct fluid level. For additional information, refer to **Section 307-01** .

**Cooling Fan Motor and Shroud****Degas Bottle and Power Steering Reservoir**

Item	Part Number	Description
1	N606676	Power steering reservoir bolt
2	3531	Power steering reservoir
3	8W005	Degas bottle overflow hose
4	8B273	Degas bottle supply hose
5	W505424	Degas bottle bolt
6	8A080	Degas bottle

**Cooling Fan Motor and Shroud**

Item	Part Number	Description
7	8B274	Upper radiator hose
8	7T028	Transmission cooler tube
9	14A464	Cooling fan electrical connector

10	N606676	Cooling fan motor and shroud bolt (2 required)
11	8C607	Cooling fan motor and shroud

**Removal and Installation**

1. **⚠ WARNING:** Before servicing a vehicle equipped with a fire suppression system, depower the system by following the procedure in **Section 100-02B** . Failure to follow the instructions may result in serious personal injury.

Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the bolt and position aside the power steering reservoir.
  - To install, tighten to 10 Nm (89 lb-in).
3. Disconnect the degas bottle overflow hose and the supply hose and position aside.
4. Remove the bolt and the degas bottle.
  - To install, tighten to 10 Nm (89 lb-in).
5. Disconnect the upper radiator hose and position aside.
6. Detach the transmission cooler tubes from the cooling fan motor and shroud.
7. Disconnect the cooling fan motor and shroud electrical connector.
8. **NOTE:** Position the lower radiator hose away from the cooling fan motor and shroud.

Remove the 2 bolts and the cooling fan motor and shroud assembly.

- To install, tighten to 10 Nm (89 lb-in).

9. **⚠ WARNING:** If the vehicle is equipped with a fire suppression system, repower the system. For important safety warnings and procedures, refer to **Section 100-02B** . Failure to follow these instructions may result in serious personal injury.

To install, reverse the removal procedure. If equipped with a fire suppression system, repower the system.

10. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

**Degas Bottle**

Item	Part Number	Description
1	8W005	Degas bottle overflow hose
2	8B273	Degas bottle supply hose
3	W505424	Degas bottle bolt
4	8A080	Degas bottle

**Removal and Installation**

1. **⚠ WARNING:** Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn counterclockwise. When the pressure is released, remove the pressure relief cap.

2. Using hose clamp pliers, clamp the degas bottle supply hose.
3. Using a suitable suction device, siphon the coolant from the degas bottle.
4. Disconnect the degas bottle overflow hose and supply hose.
5. Remove the bolt and the degas bottle.
  - To install, tighten to 10 Nm (89 lb-in).
6. **NOTE:** Do not reuse hose clamps. Instead, use appropriately sized worm-style clamps in place of the constant tension clamps.

To install, reverse the removal procedure.

7. Fill the degas bottle. For additional information, refer to Cooling System Draining, Filling and Bleeding for the recommended coolant mixture and fill level.

SECTION 303-04: Fuel Charging and Controls -  
4.6L (2V)  
SPECIFICATIONS

2010 Crown Victoria, Grand Marquis Workshop  
Manual

Procedure revision date: 08/19/2009

Material

Item	Specification	Fill Capacity
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-

**Torque Specifications**

Description	Nm	lb-ft	lb-in
EGR system module tube fittings	43	32	-
Fuel Pump Driver Module (FPDM) bolts	4	-	35
Fuel rail bolts	10	-	89
Intake manifold crash bracket bolts	25	18	-
Intake manifold shield bolts	10	-	89
Throttle Body (TB) bolts <sup>a</sup>	-	-	-
TB spacer bolts	10	-	89

<sup>a</sup> Refer to the procedure in this section.

## **Fuel Charging and Controls**

The fuel charging and control system consists of the:

- Throttle Body (TB).
- fuel rail.
- fuel injectors.
- Fuel Pump Driver Module (FPDM).

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI).
- pulse-width modulated.
- Mass Air Flow (MAF) controlled.
- fuel rail pressure and temperature sensor.

### **Throttle Body (TB)**

The TB :

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.

### **Fuel Injectors**

The fuel injectors:

- are electrically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- are deposit-resistant and self-cleaning.
- each have an internal solenoid which opens a needle valve to inject fuel into the lower intake manifold.

### **Fuel Rail**

The fuel rail:

- delivers fuel to the individual fuel injectors.
- receives fuel from the fuel supply tube.

### **Fuel Rail Pressure and Temperature Sensor**

The fuel rail pressure and temperature sensor:

- supplies the PCM with signals indicating fuel pressure and fuel temperature.

### **Fuel Pump Driver Module (FPDM)**

The FPDM :

- is electronically operated by the PCM.
  - controls voltage to the Fuel Pump (FP) module.
-

## **Fuel Charging and Controls**

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

---

**Throttle Body**

Item	Part Number	Description
1	14A464	Throttle Position (TP) sensor electrical connector (part of 12B637)
2	14A464	Electronic throttle control electrical connector (part of 12B637)
3	W506102	Throttle Body (TB) bolt (4 required)
4	9F991	TB
5	9E930	TB gasket

**Removal**

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to [Section 303-12](#) .
2. Disconnect the electronic throttle control and the Throttle Position (TP) sensor electrical connectors.
3. Remove the 4 bolts and the Throttle Body (TB).
  - Discard the TB gasket.

**Installation**

1. Install a new gasket, the TB and the 4 bolts.
  - Tighten the bolts in 2 stages.
    - ◆ Stage 1: Tighten to 9 Nm (80 lb-in).
    - ◆ Stage 2: Rotate an additional 90 degrees.
2. Connect the electronic throttle control and the TP sensor electrical connectors.
3. Install the ACL outlet pipe. For additional information, refer to [Section 303-12](#) .

## SECTION 303-04: Fuel Charging and Controls - 4.6L (2V)

2010 Crown Victoria, Grand Marquis  
Workshop Manual

## REMOVAL AND INSTALLATION

Procedure revision date: 08/19/2009

**Throttle Body - Spacer**

Item	Part Number	Description
1	6K817	Crankcase ventilation tube
2	N906154	Throttle Body (TB) spacer bolt (5 required)
3	6K817	Evaporative Emission (EVAP) vapor tube
4	-	EVAP vapor tube-to- TB spacer quick connect coupling (part of 6K817)
5	-	Brake booster vacuum hose clamp (part of 9C490)
6	2365	Brake booster-to- TB spacer vacuum hose
7	-	Crankcase ventilation tube-to- TB spacer quick connect coupling (part of 6K817)
8	9E498	Fuel rail pressure and temperature sensor vacuum hose fitting
9	9L437	TB spacer seal
10	9A589	TB spacer
11	-	EGR system module tube-to-EGR system module fitting (part of 9D477)
12	14A464	EGR system module electrical connector

**Removal and Installation**

**⚠ WARNING:** Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always

**present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

1. Remove the Throttle Body (TB). For additional information, refer to Throttle Body in this section.
  2. Release the clamp and remove the brake booster-to- TB spacer vacuum hose.
  3. Disconnect the crankcase ventilation tube-to- TB spacer quick connect coupling. For additional information, refer to Section 310-00 .
  4. Disconnect the Evaporative Emission (EVAP) vapor tube-to TB spacer quick connect coupling. For additional information, refer to Section 310-00 .
  5. Disconnect the EGR system module electrical connector.
  6. Disconnect the fuel rail pressure and temperature sensor vacuum hose fitting.
  7. Disconnect the EGR system module tube-to-EGR system module fitting.
    - To install, tighten to 43 Nm (32 lb-ft).
  8. Remove the 5 bolts and the TB spacer.
    - To install, tighten to 10 Nm (89 lb-in).
  9. To install, reverse the removal procedure.
    - Inspect the TB spacer seal.
-

**Fuel Rail**

## Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

**Removal and Installation**

**⚠ WARNING:** Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

**⚠ WARNING:** Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

**⚠ WARNING:** Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.
